like HDX and HDRATE (862KB/s and 31ms seek) I can access the drive, but it
cannot be used from desktop or tos. Is there a driver which can access
drives at address 5 or 6.

Not at the moment (as you can see: 4/420:-). I⍰m still searching for cheap
used SIMMs. Any offers;-)

>How does it work ?

With my Rev. D/C Falcon there are problems with the 40Mhz mode. :-(
I⍰ll have to try a view things mentioned in the manual.
Sometimes it runs without problems for hours and somtimes it crashes all 5
minutes in the 40MHz mode. (and I don⍰t wanna switch back to 32 or 36)
Great card! Hope I get my memory soon!
An software update for faster RAM-access will be out soon.

Has anyone seen/heard about Lexicon V1.0, it is an accessory which allows you to
simulate keyboard input by drawing shapes with the mouse. It received a
reasonably
good review in the P.D. section of Atari World, I think it was Issue 6.
The accessory was written in GFA Basic. Not long after I wrote the accessory I
noticed that it was causing 'mouse-droppings' to be left behind on the screen. I
used my Falcon FacTT File connections to tackle the problem and discovered that
the
MOUSEK command, which I was using as part of an EVNT_TIMER repeat/until loop. I
was
advised to use the MKSTATE command, but this did not solve the problem. All I
want

to do is detect a right mouse-key press and call a procedure, does anyone know how I
can do this without interfering with the screen updates?

Hallo Leute.

Ein Freund hat ein Problem.

Er hat an seinem MEGAST einen AT-Bus frei (IDE) und

moechte dort ein CD-Rom Laufwerk anschliessen.

Seine Probleme:

1. Ist das ueberhaaupt moeglich?

2. Gibt es CD-Rom Laufwerke, die er sowohl an seinem

ATARI als auch an einem PC anschliessen kann (nicht

gleichzeitig sonderd prinzipiell)?

3. Welche Treiber-Software gibt es da fuer den ATARI?

Hilfen und Anregungen bitte per PM (siehe footer).

Danke

Klaus.

It looks like you are not telling GCC to include the GEM library in your program. GCC will not automatically grab whatever libraries are needed, you have to tell it what libraries to include. Just add them to the command line (I assume you are) invoking GCC to do the compile, assemble, and link in one go. If not, pass the libraries to the linker).

I WOULD HAVE EMAILED THIS BUT jib@login IS HARDLY A VALID ADDRESS :-)

You should handle window redraws in the same way regardless of whether the window is on top or behind other windows. As long as you use wind_get with modes WF_FIRSTXYWH and WF_NEXTXYWH to walk the list of visible rectangles for a given window it should work fine. Don't forget to use wind_update(BEG_UPDATE) and wind_update(END_UPDATE) wrapped around the code that walks the rectangle list.

If you need any more help, email me. I'm only too glad to help another Atari programmer.

Steve.

Basically all your routines that draw on the screen especially those that update windows should walk the rectangle list using a classic routine like this.

This way only the exposed rectangles get drawn.

```
void do_redraw(short xc,short yc,short wc,short hc,short whand,short vw)
{
      short clip[4];
      GRECT t1, t2;

      graf_mouse(M_OFF,NULL);
      wind_update(BEG_MCTRL);
      t2.g_x = xc;
      t2.g_y = yc;
      t2.g_w = wc;
      t2.g_h = hc;
      wind_get(whand,WF_FIRSTXYWH, &t1.g_x, &t1.g_y, &t1.g_w, &t1.g_h);
      while (t1.g_w && t1.g_h )
      {
              if (rc_intersect(&t2,&t1))
              {
                      clip[0] = t1.g_x;
                      clip[1] = t1.g_y;
                      clip[2] = t1.g_x + t1.g_w - 1;
                      clip[3] = t1.g_y + t1.g_h - 1;
                      if (whand) my_clip(vw,1,clip);
                      just_draw(whand,t1.g_x ,t1.g_y ,t1.g_w ,t1.g_h, vw);
              }
              wind_get(whand,WF_NEXTXYWH, &t1.g_x, &t1.g_y, &t1.g_w,
&t1.g_h);

      }
      wind_update(END_MCTRL);
      graf_mouse(M_ON,NULL);
}

as long as your AES supports CICONS and you have used rsrc_load to load the resource,
displaying CICONS is simply a matter of calling objc_draw. If you have an older OS,
you should find that Interface comes with a library for using CICONS on older machines (exteneded resource loader, etc) as rsrc_load on older machines will not load
resources with CICONS in them....

(I use a similar approach in the new versions of DUftp & CLA, although I have a falcon
I thought it would be nice to support colour icons on older machines. I borrowed the
code to do it from the guy who wrote the Myriad desktop for MiNT....)

  My name is Scott Glasrud, and I am running for the New Mexico State Senate
during the 1996 elections. One of the reasons I have chosen to run is to combat the
proposed state and federal regulations of the Internet. As you know, the Internet
was never designed to be regulated! It was designed to allow communications in

the event of anuclear war or a major catastrophe. I OPPOSE REGULATION, and if elected
will fight to preserve your constitutional rights. HOWEVER, I NEED YOUR HELP!

I am asking each person who reeives this message to send $5.00 to the Scott Glasrud Campaign Committee. If we pull together, we CAN protect our first amendment rights! HELP ME show the politicians the POWER behind this important NETWORK. Please send contributions to:

The Scott Glasrud Campaign Committee
11024 Montgomery Blvd. NE, Suite 179
Albuquerque, New Mexico 87111

Thank you!

<< The Atari Jaguar underground hackers' mailing list >>

U G D - J A G

ANNOUNCEMENT:

This is a new mailing list started for free discussions and the information exchange about _programming_ the Atari Jaguar. #1#

The intention of this mailing list is to have a forum for people, who hack the Jaguar (for fun, not neccessarily for profit). This list will probably be mostly comprised of - but not restricted to - people using Roine Stenberg's "Jaguar Server".

```
  * The intended audience for the list is people who really  *
  * do some work/hacks on the Jaguar and are interested in   *
  * communication about it. (No hack too small!)             *
```

The mailing list is both unmoderated and closed at the same time, which means that you are free to post anything on the mailing list without approval by a moderator, but that access to the list is restricted. You need to be approved in order to get on the list. Troublemakers can be kicked off the list.

HOW TO SUBSCRIBE:

1. Send a mail to

   majordomo@rhein-main.de

   with the message

   subscribe ugd-jag
   end

2. Then send a mail, stating your interest in the list, to

   nat@zumdick.rhein-main.de

   Please give a little bit of your background in this second mailing so that approval will be quick and painless. You will not be approved to the list, before your statement is received.

FOR YOUR INFORMATION:

Apart from the 'regular' Atari Jaguar developers, there is a small base of people writing software for the Jaguar.
There is the "Jaguar Server" by Roine Stenberg, which allows downloading programs from an Atari Computer to the Jaguar using a hardware modification. Development software is partly written, partly on the way, partly waiting for you to be written.

For more information about the "Jaguar Server" please contact Roine Stenberg directly by writing to: "roine@stacken.ct.se".

This mailing list is setup in coordination with Roine by the way, so you can consider it the "offical Jaguar Server mailing list".

Looking forward to meet you on the ugd-jag list soon!

Nat!

#1# If your interest is _playing_ the Atari Jaguar, you will be
      far better served with the regular Jaguar mailing list
      (listserv@bucknell.edu).

I assume, without any actual evidence, that the information for a window is
encoded in a structure, but I haven't been able to find this in my sources -

Lattice C manual, !Compute Aes and Abacus Gem Programming.
Can anyone refute my belief or supply the structure?
I'm trying (purely for entertainment) to transfer ST 'look and feel' to the
PC using djgpp and the information would clarify some of my thinking.

If anyone is interested, I have the Wolf 3D source code.

Just give me an email address and I'll mail it to you.

Cheers,

If your TV has a SCART video input then you just buy a cable from [shrug]
wherever you buy Atari cables from. Toad or Best Electronic I guess.

If your TV only has a co-ax input then um, buy another telly.

Any internal AES structure supporting windows has never been made public so you must assume this is intentional on the part of the coders/designers. By doing this they preserve the right to change implementation without causing user programs to fail.

However, I agree that the neatest way for a user to implement a window application is by the use of structures. You would need to be quite crazy to ignore the obvious relationship between sets of data.

In the (limited) experience I have had all I can say is that you should avoid the temptation to include in your own structures that data which is directly accessible by window_get etc. If the AES is keeping these properties securely you do not need to keep them yourself - in fact it could lead to great trouble if your data and the AES data manage to get out of step.

Hello!

Can anybody tell me if there is any tool to convert documents from
Signum 2 to e.g. ASCII or any standard DOS or UNIX format.

This tool has to work under DOS or Unix of course, as if my friend's
ATARI would still work, we wouldn't need this anyway...

(Maybe any 68k/Linux people know some possibility?)

Please answer by email, as I don't follow this group regulary.
With best regards,

Agreed. The only time you need to keep the state yourself is when you
iconify *all* the windows into one icon. You are supposed to close and delete
all the windows; I can't see a way of restoring the previous positions etc
just using the AES. Obviously, you'd only need to do this when you got the
ALLICONIFY message...

By the way: you can't afford to ignore the ALLICONIFY message, even
though many programmers find it too much of a fuss, including those
at Atari.

Atari, atari. Many applications ask for a SMALLER button in their
windows, but only react to single iconify requests. However, the AES
is so friendly as to reserve a slot for an icon anyway, which is never
freed, resulting in a gap between the icons aligned at the bottom of
the screen.

(not to mention that it is impossible to allocate an icon slot if your
application wants to support iconification by keyboard shortcut---the
slots get allocated if and only if the user clicks on the SMALLER button.)

(not to mention the absence of parameters for icon placement)

(not to mention the absence of a `pack icons' function)

Some protocol! Absolutely beautiful. Too bad it doesn't work.

Mint 1.12, MinixFS 6.0 (?) and GCC 2.6.3 (I think)

>1. How much RAM do you have in your machine (GCC 2.5.8 & up likes 4 Meg).

4mb.

>2. Did you set the TEMP variable to a valid directory.

Yep, to root of the minix drive.

>3. Did it ever work (ie. did you compile the version of Mint that you use).

Not for any 'real' program - Simple 'hello world' programs work, but give it a useful program, and it moans about library routines...

Part of the problem was that I was not specifying GEM libs when linking,
(ie -lgem on the command line) but some functions (menu_create, menu_title,
objc_state, objc_newstate and a couple of others) still give error messages
in the form described above...

Cheers

Anthony

if you mean the window information for size/border elements/title etc. here
is how it works:
Normarly you first create you window before you open (=display) it. For this
you tell the AES the window properties. When creating the window you have to
deceide what elements your window should have (f.ex. Title bar/
Info bar/Closer etc.). You do this using:

window_handle = wind_create (something);

You will receive a handle as an identification for your window. For the
window you have to set set all elements have have asked for (f.ex. set the
title of the window). For setting _all_ these elements there exist one
AES-call: wind_set (window_handle, what_to_set, ...). For example:

wind_set (window_handle, WM_TITLE, window_title_string_adress, ...);

You do this for all your window elements. If you wish, you can internally
keep these information in a structure. If you don't, you can ask the AES for
the information using wind_get (window_handle, what_do_you_want_to_know, ...).

All the used #define's are defined in AES.H
For a complete introduction to VDI and AES you should read
"Professionell GEM" by Tim O..... (oh, what was his name??)
An older, but still usefull lecture on GEM. It can be foud on many
FTP servers with atari software an documents.

If you cannot find one, just ask me for a copy.

Hope it helps,

Martin

If you using C to get the look and feel a structure would be the obvious choice. On the ST the programmers never engages directly with the window data rather they ask the OS via wind_get() etc. But if you want the look and feel of the ST on the PC what about DR GEM for the PC or you can by Gemulator and run your 68K ST/TT/Falcon Progs.

Matthew

On the contrary, I believe that these structures are known to the general public (if I understand what is being discussed). Check a =
book entitled _Programmer's Guide to GEM_, by Phillip Balma and William Fitler (ISBN 0-89588-297-3). These two guys worked on the GE=
M project for Digital Research--they helped design the system. About the first one hundred pages discusses the structures and links =
that are intrepreted by GEM as windows, dialog boxes, etc.

newsgroups: comp.sys.atari.programmer

I've just installed gcc 2.6.3 for MiNT, but nothing will compile. All I get is a 'gcc: installation problem, cannot exec as: file not found' message after a long pause and a fair bit of disk activity.

My MiNT setup is as follows:

STFM - Tos 1.2, 4m Ram, 170m HD, two 16m MinixFS partitions (/l and /m)
TAF Chimera diskset - calling tcsh instead of xinit (runs OK, but slooooow!)
FreeMiNT 1.12.4

I untarred the .tgz from root, so that the executables dropped directly into my path, and placed the libs/includes (PL 46) thus:

Libs: /usr/local/lib
Incs: /usr/local/lib/gcc-lib/m68000-mint/2.6.3/include

My question is therefore: what's missing? I've not set GCCINC, etc. yet, as the docs stated that it looks for these in a number of places, and I assumed that these locations were obvious candidates, and I'm not getting 'cannot find xxxx.h' messages as I did before I installed the libs/incs.

Anyone got any ideas?

Be seeing you...

Hi Folks,

Does anyone know of a site where I can find source code (preferably C) showing examples of using the MIDI ports on the Atari ST.

I started writing (what I thought would be) an easy program to Dump/Load programs between the ST and a synth module. I have difficuty reading stuff coming from the MIDI In port.
Large parts of these messages seem to go missing. I'm currently using the BIOS calls to put/get characters to/from the MIDI ports.

Info on any sources of such information would be gratefully received.

Thanks,

Dave Crossen (dc@scms.rgu.ac.uk)

As part of my STOS Falcon Extension, I want to have Direct to Disk replay/record routines. I have an idea as to how this works, but do not have any details on how to actually implement the DMA reading from disk...

I guess that you set up a buffer, and set up the sound sub-system to play and to loop back to the beginning when it reaches the end. This part I can do. However, I assume that there is a system call to read /write memory directly to/from a file. How?

Thanks in advance

Anthony

It looks like you forgot to install the assembler (aka `as'). Get some recent version of gas (GNU assembler) and drop it in /usr/bin.

Gcc is just a small front-end program which starts other programs to do
the real work. For example, if you type `gcc -c foo.c', gcc passes the
the file foo.c to the C preprocessor (cpp). The output of cpp (written
to a temporary file in /tmp or /var/tmp) is passed to the C compiler
(cc1). The output of cc1 is passed to the assembler (as), which creates
the object file foo.o.

BTW you'll also need a linker (aka `ld'), if it's not already in /usr/bin.
The linker needs a start-up stub (crt0.o) and most likely the standard C
library (libc.a).

G'luck,
Waldi

Sounds like what you need is a 6502 disassembler. Something like that could be available for just about any computer, though it might be really hard to find. I've seen a disassembler like that for the Atari ST systems, but I think you'd be hard-pressed to find one for IBM-compatible or other computers. (The debugger included with the Atari 2600 Action Pack for the PC might do the trick, though.)

If you get a copy of my M1 editor (/Music/eked-m1.zoo in atari.archive)
the file midi_com.c has source to load and dump banks. The basic idea
is to bypass the system calls and read data out of the MIDI buffer
directly - the BIOS calls are _far_ to slow for reliable operation
on a stock ST.

Don't use the BIOS calls, use open()/read()/write() instead.

The demo version of Pure Pascal is great - includes the source debugger
(well integrated) and the Turbo Pascal BGI stuff.

Doesn't compile to disc though...you have to buy the full version for that.

Yes, just use Supexec() like you would do in TOS. Supexec() is recommended
instead of Super() but I don't know why. Keep your supervisor routines
short and sweet, as Mint cannot multitask whilst a process is in a supervisor
section.

Hello,

    I've been trying to link assembler subprograms into my C code.
The Pure C manual says it should look like this:

```
TEXT
MODULE refresh
        move d0,d0
        rts
ENDMOD
```

(The example is, of course, `:-)'.)

But I get a linker error about `refresh: undefined symbol'.
When I do

```
TEXT
EXPORT refresh
refresh: move d0,d0
         rts
```

all works well, but this is aesthetically much less pleasing. What am
I doing wrong?

Regards,
--

You're doing NOTHING wrong! And, as for aesthetics, it is better that you
have to explicitly nominate external references rather than assume that ALL
internal labels are accessible. Thumbs up to your assembler/linker for
being hygenic about this :)

The assembler manual clearly states that the label following the MODULE directive is visible in the source file where it is defined. The label is *not* visible in other source files. You have to explicitly export the label to make it visible in other source files.

In my manual this is explained on page 111: "Nach MODULE folgt der Name des Moduls. Er ist auch ausserhalb des Moduls sichtbar. Soll er jedoch aus anderen Quelltexten heraus angesprochen werden, muss er wie jedes andere Label exportiert werden."

```
.EXPORT  refresh

.TEXT
.MODULE  refresh
     move d0,d0
     rts
.ENDMOD
```

In addition, the scope of any label defined between .MODULE and .ENDMOD will be limited to the module (unless explicitly exported).

> When I do
>
> TEXT
> EXPORT refresh
> refresh: move d0,d0
>   rts
>
> all works well, but this is aesthetically much less pleasing.

This is very different from using modules, which are treated as
a unit by the linker (i.e. if there are several modules in the
same source file, the linker only pulls in the modules which are
actually used). The MODULE directive is mainly provided to easily
build libraries whith many small subroutines (the alternative is
to put each subroutine in its own source file).

> What am I doing wrong?

Not reading the fine manual. :-)

Not all labels are accessible. MODULE is supposed to export its name
and place the label at the first code generating statement. That way
you can have multiple MODULES in one .S-file, whose internals are
invisible for the others. (So no more loop237864 labels :-)

I have an Atari falcon which I use mostly for music and a Mac which I use for
graphics. I also have an Epson Sylus Color II which seems to work
incredibly slow on the Mac. I was thinking about trying it out on the
Falcon, but I don't know if there are any drivers that support the 720
dpi resolution mode on the printer, or what I else I would need to
import a color image, view it on the Atari, and hopefully, print it.

If I can't print it, it still would be nice to at least view it on the Falcon,
since it has a video out, something that costs a few hundred bucks
to add to the Mac.

--
In case you haven't heard of 'BAD MOOD' before, it's the current name of
the project to create a DOOM(TM) .WAD compatible game for the Falcon030.
--

The BAD MOOD project has had a mailing list running for a few weeks.
From the start we intended this to be available to anyone, but we thought
it would be best to do some kind of digest of our previous conversations
first. We still think so, but there never seems to be any time to do it
properly...

So, the mailing list is hereby announced. Join by sending email to
bad_mood-request@rand.thn.htu.se with the word 'subscribe' as subject.

The list is intended for 'serious' discussions related to the BAD MOOD
project. Participants who can't deal with this run the risk of having
their post access removed. Unless you're someone like Peter Sinclair
(far too often seen on rec.games.video.atari), I don't think you'll have
to worry about that, though. ;-)

It's recommended that you check out the previous discussions before
posting questions since a lot of things have been covered earlier.
All the email exchanged so far can be fetched by WWW/ftp.
Take a look via WWW or fetch the 'readme.1st' file by ftp to find out
more. The WWW/ftp site is mentioned below.

> I doing wrong?
```

Well, just add EXPORT refresh to the first example, and all works well.
Using MODULE/ENDMOD does not automatically export the symbols (the routines may be static), it only makes it possible for the linker to decide which parts of the code it must use and which not.

Ciao

Thomas

Now that I have a WWW browser that doesn't require mint and X windows I'd as soon do away with the unix like partition on my hard drive without reformating the HD, anyone know of a program or method to do this, any ideas would be appreciated.

gary

Updated: 10/05/95

NOTE: A few things added, some sold, many prices dropped.
Enclosed is a list of the hardware and software that I am selling.
Please send me an e-mail if you are interested in something.
All prices are NEGOTIABLE.
I can not keep up with the newsgroups, so please use one of the below
ways of contacting me.
You can contact me at:

BBS: (412)343-1422
Internet: asmodeus@telerama.lm.com
WWW: http://www.lm.com/~asmodeus/
there is a link on my home page for the current list of atari items

All above prices do NOT include shipping, and will be dealt with on an idividual basis per order. All prices are in US Dollars, and payment is to be in US Funds. Money Order payments will be shipped the day after I receive payment, and personal checks payments will be shipped when the check clears.

ATARI HARDWARE FOR SALE
All harware is Negotionable in price.
COMPUTERS:
1040 ST/F 1meg memory $130.00
1040 STE 4megs mem. $300.00

MONITORS:
Color Monitors atari brands $100.00
Color Monitors atari brands $100.00
(P) Color Monitors(broken, power box) $25.00
SM124 Mono Monitor $75.00

STORAGE DEVICES: (Hard drives and Floppy)
Indus GT External 720k Floppy $70.00
Toadfile 130meg + 80meg HD w/ICD+ host $250.00
ShoeBox 80meg HD w/ICD+ host $110.00
20meg shoebox, atari adapter $90.00

OTHER HARD WARE:
WICO Bat-handle joystick (9-pin) $10.00
Epyx The Grip joystick (9-pin) $10.00
The BEst TrackBall $20.00
The Cordless Mouse (Practical Solutions)$30.00
Mouse Master $20.00

VIDEO:
Video Key $30.00
ST Video Digitizer $15.00
The Complete Colour Solution (Sold ONLY as a set)
(Vidi-ST, Vidi-RGB and VidiChrome ST) $90.00

AUDIO:
Stereo Replay audio digitizer $85.00
ST Sound Digitizer (Hippopotamaus) $25.00

PARTS:
2 assorted Atari internal floppy drives for parts $8.00
1040 case and rf shield $10.00
4 Atari 256k Simms from Ste (Make Offer) $35.00

Why don't you use true color? In most cases, it is a loooot easier and faster.
And it's prettier, too.

HI there,

 I'm searching for a so-called chunky-planar converter DSP code, because the one I've got is far too slow.(I mean the dislay's got 8 bitplans(256 colors), the chunky is a "logical" one byte per pixel display, the planar one is the Falcons 8-bitplane-bitacrobatic video mode with 320x200 resolution.)

     Thanks in advance,

                    Zoltan Sebestyen

You never need ,,loop237864 labels''. The Pure C assembler supports
local labels (described in section `Lokale Labels'). The advantage
of a Pure C module is that it is treated as a unit by the linker.

Firstly... thanks to those people who pointed out that I was missing 'as' (and
'ld' too, as it turned out) in response to my original query:

What I'm getting now is one or other of the following:

1) 'ld: cannot find file for: gnu.olb'
2) 'ld: cannot find file for: crt0.o'

The two files in question were originally in the directory:

/usr/local/lib/gcc-lib/m68000-mint/2.6.3/ (which resulted in message 1)

so I moved *.olb and *.o to /usr/local/lib (resulted in message 2)

so put simply: where should these files go?

Thanks (again) in advance...

Be seeing you...

So why wasn't the EXPORT in the fine manual? :-)

The example just quoted a C source with an assembler source below,
without the EXPORT IIRC.

Anyway, I'll try this.

Thanks,

Sorry, I dont seem to have been specific enough. I cannot use the VDI,
as it is within a STOS extension. I cannot use the XBIOS, as there are
problems on TOS 4.01/2 when changing from an ST mode (ie from STOS!!)

The mode is being changed by directly copying a register dump into the hardware video registers. It appears as if they dont actually hold a bitpattern which tells you the number of colours (16,8 and 1 bpp are covered, but not 4 and 2) Yet a 16-colour register dump WILL switch to 16 colour mode....

:-)

I'm in the midst of finishing a little CPX that lets you set the program flags. Just drag programs onto the CPX window...

This is a problem with GFA basic, and I have no idea how it can be
cured (if it can). This was one of the most frustrating things I
discovered when I was still programming with GFA Basic. This same
droppings happen even with evnt_multi when using low values on
timer. The droppings won't happen if you just wait for the
mouse input in evnt_multi (or evnt_button, if you don't have anything
else to check).

I don't know how your program is built, but it sounded to me
like you was waiting for the right mouse button in busy loop
similar to this:

```
DO
  EVNT_TIMER(something low I guess)
WHILE (MOUSEK <> 2)
```

If this is the case, mouse droppings will happen while being in this
loop. You should make this call using AES functions instead.

Like evnt_button(I can't remember the parameters).

This call returns immediately when the button state is like you
want it to be.

Dann kein die CPU, der Bus leider nicht mehr verkraften.
Hast Du einen K□hlk□rper auf die CPU geklebt?
Am sichersten ist wirklich W□rmeleitpaste, viele K□hlk□rper
sind nicht unbedingt 100% Plan, es kann sich ein winziger
Spalt zwischen CPu-Oberfl□che und der K□hlk□rperunterseite
bilden, das W□rmeproblem ist dann schlimmer als ohne K□hlk□rper.

L□uft er stabiler wenn Du die hohe Bildschirmaufl□sung runternimmst?
(Z.b Monochromemode?)

Ich betreibe einen in einem F030 Rev.A da laufen die 40Mhz sehr stabil.

Gru□, Robert

Sounds nice and complicated - are you using Thing (AV server) or the plain
desktop?

I'm going to have to get into inter-program communication
soon.

I want to use my own mousepointer, sprite type,
in my program but,
if I use HIDEM there is still old mousepointer,
especially if I use screen flipping.
How can I avoid it?
This listing shows method I've tried.
It works quite good because my new mousepointer is
far away from original(hidden one).
But I want it to be exactly in mousecoordinates x and y.
And I don't want to redraw whole screen again if it
is possible avoid.
Also I want to use diffrent shapes in different part of
screen, but I think I can hadle that.
All comments,helps etc. Yuo can give to me are welcome

Hi, having now got working FLI/C player code (displaying in true-colour)
I now want to extend it to support FLH files (as created by Apex). So...

Does anyone know where I can get the Fileformat (or even better, code)
for FLH files....

Someone must know... (doug ;)

I had the same problem. Such a file as an unknown magic,
the header says 16b bitmap, and the data chunk id is 27. This means nothing if we
refer to the documentation. It is neither byte nor word-packed nor
uncompressed...
How can we display such a format ?

FLH, is that the same as FLX format produced by Lexicor's phase-4 stuff
or PC's tempra's turbo animator? These are 15-bit animations, 32K colour
but I can't play them on my 16-bit (65K colour) card.

It uses the Atari Drag'n'Drop protocol as well as the AV Protocol. It reacts
to anything it gets sent, basically.

I can also drag files from Freedom onto it, and it works OK!

Sadly it does not work under MagiCMac.

Has anyone got _any_ Atari debugger to work with MagiCMac?

Sounds like we are doing similar stuff.

I've written an easy to program GEM interface for writing applications. It can put dialogues into windows and handles all the messages etc. I've got it to the stage where I'll soon be after people to test it but it seems a shame to not have it able to run in the background under MultiTOS and Geneva just because I don't have the docs to enable their equivilent of MagiC's WM_BOTTOM message.

You'll find documentation for the AV protocol in the Thing.59E

Desktop archive (available at any Atari FTP site). The docs are in
ST-Guide Hypertext format, but they are in english.

Hi everyone,

I'm currently developing some code which will talk to a pop server and
download my mailbox - I couldn't find one in any of the archives which
would do this. Anyway, I've got it working under MiNT either talking
directly to /dev/modem1 or using sockets, but I have come across a bug
or maybe its a feature ;-)

All POP messages are terminated with CRLF pairs, but the fgets() call
always seems to translate these into LFLF pairs. Any insight would be
appreciated - I don't want to special case this code, as the same
code works on my Unix box without any problems.

: ARGV protocol

: all new AES messages since TOS 1.2, especially the AV_PROTOCOL.

: multitasking extentions. I have some documentation that came with MagiC but I
: need to know more, and I need to know about Geneva and MultiTOS. For instance,
: how do I enable background window operations under Geneva and MultiTOS.

If you know german, you could use the E-GEM library which AFAIK
(I don't understand german) does most of the window processing
work for you. It offers windowed dialogs, drag & drop, etc.

Or, if you don't intend to do apps, just output some windowed
graphics stuff, you could try my own lib. It's currently works
with xgemfast (SozobonX C), but I'll intend to fix it for gemlib
some time this year. Currently it only supports black and white
colors as I'm unable to debug color output on my monochrome monitor.
However, it should work on every resolution as it uses VDI/AES for
output.

The library will need NVDI 2.5/newer or Enhancer TSR for off-screen
bitmaps that are needed for window backups (all window output is
buffered for redraws and speed reasons). I have done a couple of simple
graphics examples and games with it. A test version is available
through my WWW page:

Did you open the 'whatever' as binary, or as text? The core of fgets is:

```
        while((--limit > 0) && ((c = getc(fp)) != EOF))
                if((*p++ = c) == '\n')
                        break;
        *p = '\0';
```

That shouldn't mangle CRs into LFs!

Hi Ben!

It's a matter of how you open the file. On the Atari the default
behavior for fgets() is to convert the CRLF pairs to LF (or NL in Unix
parlance) on input and vice versa on output.

If you want to disable this conversion you have to append a "b" for
binary to the type string, i.e. the 2d argument to the fopen() call.

E.g.:

```
    fp = fopen("foo.bar", "rb");
    /* ... */
    while (fgets(buf,BUFLEN,fp) != EOF)
        /* process unconverted buffer contents here */;
```

The "b"-type-modifier also applies to the freopen() and fdopen()
functions and will be ignored by most Unix f*open() implementations.

Tschuess

  Jens

You could also use the AES's screen handle, the one you get back
from graf_handle().

summary: Atari ST H/Software for sale

Updated: 10/26/95

NOTE: A few things added, some sold, many prices dropped.
Enclosed is a list of the hardware and software that I am selling.
Please send me an e-mail if you are interested in something.
All prices are NEGOTIABLE.
I can not keep up with the newsgroups, so please use one of the below
ways of contacting me.
You can contact me at:

BBS: (412)343-1422
Internet: asmodeus@telerama.lm.com
WWW: http://www.lm.com/~asmodeus/

there is a link on my home page for the current list of atari items

All above prices do NOT include shipping, and will be dealt with on
an idividual basis per order. All prices are in US Dollars, and payment
is to be in US Funds. Money Order payments will be shipped the day
after I receive payment, and personal checks payments will be shipped when
the check clears.

ATARI HARDWARE FOR SALE
All harware is Negotionable in price.

COMPUTERS:

1040 ST/F 1meg memory	$130.00
1040 STE 4megs mem.	$300.00

MONITORS:

Color Monitors atari brands	$100.00
Color Monitors atari brands	$100.00
(P) Color Monitors(broken, power box)	$25.00
SM124 Mono Monitor	$75.00

STORAGE DEVICES: (Hard drives and Floppy)

Indus GT External 720k Floppy	$70.00
Toadfile 130meg + 80meg HD w/ICD+ host	$250.00
ShoeBox 80meg HD w/ICD+ host	$120.00
20meg shoebox, atari adapter	$90.00

OTHER HARD WARE:

WICO Bat-handle joystick (9-pin)	$10.00
(SOLD)Epyx The Grip joystick (9-pin)	******
The BEst TrackBall	$20.00
The Cordless Mouse (Practical Solutions)	$30.00
Mouse Master	$20.00

VIDEO:

Video Key	$30.00
ST Video Digitizer	$15.00

The Complete Colour Solution (Sold ONLY as a set)
(Vidi-ST, Vidi-RGB and VidiChrome ST) $90.00

AUDIO:
Stereo Replay audio digitizer $85.00
ST Sound Digitizer (Hippopotamaus) $25.00

PARTS:
2 assorted Atari internal floppy drives for parts $8.00
1040 case and rf shield $10.00
4 Atari 256k Simms from Ste (Make Offer) $35.00

The LineA variables are present in TOS 4.xx for compatibility only, and may well not be supported in Future versions of the operating system [quoted from memory from Atari docs] - still as there's unlikely to be a future version from Atari themselves, your best bet would be to see what other developers are thinking of doing about continuing LineA support...

Subject: SozobonX Math library bug
Date: 1995/10/26
Message-ID: <1995Oct26.191943.15835@atlas.tntech.edu>#1/1
X-Deja-AN: 118143324
organization: Tennessee Technological University
reply-to: hwl0978@gemini.tntech.edu
newsgroups: comp.sys.atari.programmer

I've found a bug in the math library for SozobonX. I just pulled down the latest version from the German site. The file was sozlib14.lzh. It appears

that the library is missing the exp and log functions, and it won't compile anything using an of the functions in that portion of library. The following program was written as a test:

```
/* Test for pow() function */
#include <stdio.h>
#include <math.h>

int main(void)
{
  printf("2 ^ 4 = %f\n", pow(2,4));

  return(0);
}
```

When I try to compile this with:

```
cc power.c -o power.tos -lm
```

I get the following error (or something close) from the linker:

```
Undefined _exp in pow.o (libm.a)
Undefined _log in pow.o (libm.a)
```

I didn't see any address to send bug reports to. Does any one know how to get in touch with the authors?

BTW, I tried this with c68, and it compiled and ran fine, but I'd rather use SozobonX unless I need the ansi stuff in c68 since c68's code is usually about twice the size for small programs (no optimization yet).

OK!

Can AV Protocol be used to call other programs to edit objects in another
program (ala OLE 2 on the
peecee)?

Hi !

I have got a falcon with a VGA monitor connected to it. I have no access to a

rgb monitor.
Ok, you are producing most of the demos for rgb monitors. But what do you think about putting a small text-file to the archive, which tells me (and all the others) that I cannot use it.

OR: programm more demos for VGA monitors.

Bye,

   Michael Guse

> There is always vq_extnd(), but you have to open a VDI virtual
> workstation first.

nope. You can use the AES workstation returned from graf_handle

Try this...
I use lattice C 5.60, so you may need to alter this for other compilers

```
#include <aes.h>
#include <vdi.h>

int main( void )
{
     short wo[57];
     short dummy;
     short handle;

     appl_init();
     handle = graf_handle( &dummy, &dummy, &dummy, &dummy );
     vq_extnd( handle, 1, wo );
     appl_exit();

     return wo[4];
```

```
}

OR one could interrogate the line-A vars (not really recommended, though)
In Lattice C 5.06 and 5.60 it goes like this...

#include <linea.h>

int main( void )
{
     struct la_data *ladptr;

     ladptr = linea0();
     return ladptr -> li_a0 -> la_vplanes;
}

In both cases the return value from main is the number of planes. the
former is more portable up and down the range, the latter is not
necessarily so.

> Undefined _log in pow.o (libm.a)

Well, I got it to compile finally, but there is still a problem. Since it was
linking under c68, I decided to compare the libm.a's from c68 and sox. The
order was different, and the exp.o and log.o came AFTER pow.o in c68's while
they were before in sox's.

This gave me the idea to try libsort on sox's libm.a. Well, when I sorted it,
it no longer gave me the _exp and _log errors, but 2 other undefined symbols
popped up in libm.a! ARGH. Anyway, I got to looking at the man pages for ld,
and found an option of -p that causes it to make as many passes through the
library as are needed to define all symbols. It turns out that when I use this
option, it links and runs fine.

There still is a problem with the math libraries, and I would like to let the
author's know, even though I have a work-around.

> BTW, I tried this with c68, and it compiled and ran fine, but I'd rather use
> SozobonX unless I need the ansi stuff in c68 since c68's code is usually about
> twice the size for small programs (no optimization yet).

Actually, it DIDN'T run fine. It looks like C68 has a problem with malloc. The code I was trying to compile before my little simple program malloc'd some space for a structure, and it was crashing everytime it tried to assign something to the structure. I put in some code to check what malloc was returning, and it was returning something like $FFFF8A80! I don't have THAT much memory, and besides in the 68000, that is an invalid address. Maybe that explains the 2 bombs... :)

With the same debugging code in place, and the workaround mentioned above for sozobon's math lib, the same code returned a much more reasonable value, and compiled and ran fine. Phew...

Any help getting these bugs fixed would be appreciated. Thanks.

Over the last year or so I've been developing an easy to program front end for GEM which I've called 'Programming Utility for Gem'. I am now looking for people who are prepared to test it by writing GEM programs of their own using it. Helpful testers will get a free copy when it's released.

Brief Description of PUG
==========

Dialogue trees presented in windows with enhanced functions, such as a capability to size down a window and scroll around a dialogue without the need to write any code for it.

Keyboard shortcuts are invisible to source code by virtue of being translated into the mouse operation they represent.

CHECKABLE, CROSSABLE, OUTLINEABLE features handled automatically in the same way as the SELECTABLE attribute - also works in conjunction with RADIO buttons.

No wired in window limit. The number of open windows is restricted by the operating system used, not by PUG.

All mundane window messages handled automatically by default - ie moving, sizing, redraws, etc. Any message for any window can be trapped, without affecting the others, by user code to perform custom operations.

Custom redraw routines can be installed without the need to take full control over the redraw process.

Automatic detection of MagiC whereupon windows will work in the background and automatic conversion of the PUG keyboard shortcut convention to the new underscore convention. Future versions will make provision for other multitasking systems (lack of docs problem).

Limited VT52 terminal emulation in a window (again due to lack of docs) - again, automatic handling of messages.

PUG is wired into each program you write. It does not suffer from the disadvantage of requiring an AUTO folder program or some other operating system patch. It will run anywhere a GEM program will run.

Goal

I invisage PUG to be of use to all GEM programmers.

Novices will find it easy to use because it does most of the work, leaving them free to concentrate on one problem at a time.

Experts can use the (by default ignored) vectors to install custom code leaving PUG to deal with the mundane stuff that does not need special attention.

PUG allows small utilities to be written for GEM. Previously, too much overhead made this a daunting task. A window containing a dialogue loaded from a resource file can be produced and handled using less than 2 pages of source code.

PUG is presently linked as an object archive in Mark Williams C but I will be looking at the feasibility of producing it as an overlay so that it can be used with different languages.

Requirements

==========

Good knowledge of C.

Knowledge of GEM. There's no need to be an expert because it's
supposed to be easy to program!

Ability to keep good records of problems, especially on the 'lack of
documentation' front on my part.

Carrot
======

Testers will get a free registered copy when it is released. Equally
important is that if PUG takes off you will have gained a good head
start on others. PUG will be shareware. The unregistered version will
be fully functional with the additional 'bonus' of an annoying delay
as each window opens.

Hi Michael

I think that about 90% of all demos are RGB only. The problem is that the Falcon is a bit slow. The high refresh rate of VGA monitors cause a lot of problems and that's why most demos are coded for RGB. The technical details are not that interesting.

Most democoders include readme files with their productions. Some demos can be run on Multisync monitors. I think that there will be no change in the future!

PUG sounds really interesting. although I have almost left the GEM scene (concentrating on X Window now) I would like to take a look at it.

Thanks to everybody who suggested a solution for the problem. The correct
answer was quite simple. There is a program HDPATCH or AHDICONF included in
the atari harddisk drivers where you can configure the driver. I just
configured the driver to scan SCSI unit 5 and everything works fine. The
iomega is a very nice backup system. It can be used as a replacement for
a slow harddisk too.

You can set up the VGA monitor to use 320*200 (or 320*100 used in many
true-colour productions) with 50hz refresh rate (this requires SVGA or
MultiSync of course). In this mode you only loose very little system time
and is also very good when developing, so you don't have to sit and code
on a RGB TV.

With 'ar' you can check whether the object file is in the library.
If it is, the problem is that 'ld' should be directed to make multiple
passes on the library when checking for objects (there's a switch
for it I just don't remember it at the moment). I think it rather
unlikely that a math library would miss those functions.

NVDI has an option to disable lineA support. This increases performance
and is also interesting to discover that many programmers still ignore
Atari's guidelines.

Hello,

I have a friend who has recently changed from an Atari Falcon to a PC. He wanted to use the same file he used on Data Manager Professional on his Falcon to MS Works on his PC but his PC is not playing!!! He did save the file in some kind of format on an IBM diskette and it is possible to see using MS Dos Editor, it is just that is is full of garbage, and is not recognised in any windows programmes. The files have DAT extensions and I would be really grateful if someone could give me some guidance as to what to do about this problem. It would be possible to send you the file if necessary but any form of instructon or help would be greatly appreciated via direct email to conibear@dircon.co.uk

Thankyou

Agreed. SubStation is a good game, but the graphics are very dull, due to the
fact that it also runs on a STE.

Wolf3D should indeed be possible on the Falcon, TOWERS II shows it pretty much.

newsgroups: comp.sys.atari.programmer

Probably a simple answer, but.....

When I do "dc 0.5" in DevpacDSP the value in memory is 4.9999....
and when I do "dc 1/2" the value _is_ 0.5

Why is this ? It's bugging the hell out of me.

Phil.

hello, i once programmed an exception routine and just copied the postmortem
routine from the TOS into my little prg, but however it won't work ...
can somebody tell me how to prg a propper postmortem routine ?

Hallo!

Ich hab eine Frage zu den Off-Screen-Treibern in NVDI: Wie bringt man den seit neustem vorhandenen True-Color-Off-Screen-Treiber "OFF16MOV.NOD" zum laufen?? Alle anderen Off-Screen-Treiber funktionieren problemlos (bis 32768 Farben). Ich habs mit allen Kombinationen von Format (Interleaved, Normal, Packed Pixels) und Pixelreihenfolge (Normal, Falcon, Intel) versucht, aber nichts hat geklappt. Als Plane-Anzahl hatte ich jeweils 24 und als Farbanzahl 16777216L angegeben. Was mache ich falsch?

Ueber Antwort wuerde ich mich sehr freuen, am besten bitte ueber e-mail!

In a message T.J.Rickard wrote to Magnus Kollberg:
 TJR> Towers II has vertically angled walls that cut across squares on some
 TJR> of the top levels - the mine area with the dead mages and warriors of
 TJR> the council in it, just below the top couple of levels.

I havn't got that far.... but I will some day, I hope.... ;)

 TJR> The point of doom is less the angled walls and staircases etc and more
 TJR> the mindless violence in a nice textured environment. Lasers & Men
 TJR> could be adapted to make a fine Doom clone - maybe not up to the
 TJR> original, but still fun. Not having to run two inteligent teams of
 TJR> warriors, just simple targets close to the player should free up some
 TJR> speed as well.

Why don't we ask the author of Lasers & Men to releas the game as freeware with sources, as he don't support the project anymore? I can't think that he still is getting registrations for it, or does he? With some nice graphics and better level design and maybe some other enchantments (better armory etc.) it could be very nice. And maybe also a level designer.

 TJR> I've seen enough demos and games already on the Falcon to be certain
 TJR> that a Doom clone is very possible. Not that I'd like to try and code
 TJR> one.

Why not join the team and do some work?

Cheers,
Magnus Kollberg

AFAIK SNES Doom uses a varient of the Super FX chip to run Doom.

Still good news for the Falcon tho', as this chip is little more than a
DSP!

Since every RS232 function except the ring indicator has been rerouted to
the SCC on the Falcon, how is it possible to turn off the DTR signal? What
little documentation I can find on this doesn't go into enough detail to
help me track it down.

I have been learning the basics of games programming these last few months and have found free Atari specific information difficult to obtain.

But I also have this P.C. thing and I found a wonderful little program called the P.C. Games Programming Encyclopedia. This is basically a text editor type program with all the files built in and there is a file on just about every aspect of games programming in there. This got me thinking, a nice little version of this program for the Atari, one that could be run stand-alone or as a DA.

I think this could help a lot of people who can program but are scared off by the apparent complexities of games programming. It could hopefully provide many more programmers for the platform, and this can only be a good thing, can't it?

Whadaya think? What it would require is information on the different aspects of games coding from all you wonderful programmers out there (flattery gets you everywhere!). It dosn't have to be in any particular format (I could edit it), and of course every contributor would be credited.

Any thoughts? E-mail me or post to this thread.

Here's a little example for dropping and restoring the DTR on the Falcon. I used this for my bulletin board for six months without problems. It's a bit kludgey, I know, but if you have any questions, respond via e-mail (I posted this publicly, because it has come up before).

For Lattice ASM.TTP. It's not too hard to understand.

Graham,
I disagree that a version is not possible. Just because it hasn't been done doesn't mean that it cannot be. Besides, look at all the money and programmers that have worked for pushing the SNES to its limits. You really can't compare that to the resources devoted to Falcon development. But I think Doom will become a reality for the Falcon. Does someone want to develop a custom chip for a cartridge version of Falcon Doom ;-)?

I assume you mean that the value in memory is $3FFFFF which is just a little under 0.5. (4.999 won't fit in a memory location). The number concersion part of DevpacDSP does exhibit this little bug. Normally it doesn't matter but to get round it, use:

```
dc  $400000      ;WhateverItIs = 0.5
```

That way it will load the right value, and the comment tells you the value in decimal. Or use 1/2 like you did!

If you have ever tried to code a fraction conversion function (fraction to hexadecimal and vice versa) you will understand why a bug has crept in - it is not very easy at all!

Use HSMODEM (HSMODA06.lzh) instead of direct hardware access - there is
documentation in the archive.

I'd say not so nice. Same ugly parameter passing as Turbo C (not via the stack but through registers) and the accompanying assembler does not understand forward references, as instead of still using the nice MAS-68K which came with Turbo C (up to three passes) they went for their own single pass assembler.

And if it comes to code generation, IMHO there is nothing better than GCC. The optimizer often produces assembler output I couldn't have written more efficiently. And what's more, the GCC comes for free. But you need memory, 4MB is fine, 2MB may work.

I'm using asm56001 from Motorla, but I think there are other bugs
(not related to this little "feature") in Devpac DSP. Decimal integer
numbers cannot exceed 16 bits of range, and the jmi instruction doesn't
work very good. Perhaps you can test that because I imagine it will
take a while to figure it out.

Why not just port wolfenstein, the source code is at ID and its only 500k

Get a copy working and then ID might help you port Doom To the Atari.

Hi,
I've been trying to run Cubase Audio on my 4 meg Falcon using a 2 gig Quantum Empire 2100s Scsi3 drive. The drive is recognised by the Falcon and otherwise works just fine until I go to record audio. Then I get this error message:

"Scsi error on 3"

Does anybody know what this means?

********** ANNOUNCEMENT **********

Coming soon:

```
*********************************************************************
** SampleC - MIDI sample dump, sample conversion and librarian program **
**           for the Atari ST, TT, Falcon series of computers.         **
*********************************************************************
```

List of features:

1) Supported formats:

   AVR signed and unsigned, AIFF including Cubase Audio, AIFF-C (uncompressed), WAVE (.WAV), CDP soundfiles. Stereo and mono, 8-16 bit.

2) Can receive and transmit 9-16 bit samples via the MIDI sample dump protocol.

3) Supports Atari CDP soundfile system (Soundstreamer etc.).

4) Converts between all supported formats - stereo to mono, bit conversion.

5) Non-modal interface, optimised for MagiC operating system.

6) VA_START and FREEDOM support for multiple file loading. Recursive file selector allowing every available sample to be loaded in one operation.

7) Intuitive interface - drag and drop samples, enhanced GEM facilities, 'iconification' on all TOS systems.

8) ST-GUIDE on-line manual, KOBOLD support.

9) Active registered user support.

SampleC should be available within the next month, and will probably cost 12 UK pounds for registration within the UK - overseas costs TBA. An unregistered version, which is fully functional but places an 80K limit on all sample sizes and does not include the ST-GUIDE manual, will be available. If you would like to receive the unregistered version, please send me a DSDD disc with a stamped, self addressed envelope - I cannot return discs with no postage paid.

Send to: SampleC demonstration,
Richard Evans,
3, Gervis Crescent,
Parkstone,
Poole,
Dorset,
UK.

Subject: Problem mit GDOS-Ausgabe
Date: 1995/09/16
Message-ID: <7p2Iam5B@interkom.rhein.de>#1/1
X-Deja-AN: 110327064
newsgroups: comp.sys.atari.programmer

Hallo Atarianer!

ich habe hier ein kleines Problem mit der Druckerausgabe ⍰ber GDOS,
und suche deshalb eine Doku zur Benutzung der GDOS-Druckertreiber.
Die Ausgabe versuche ich folgenderma⍰en:

1. v_opnwk; (Physikalische Workstation ⍰ffnen)
2. vst_font; (Fonts setzten)
3. vst_height; (Fontgr⍰⍰e setzen)
4. Anzahl der Vertikalen Pixel pro Seite geteilt durch Zeichenzellenh⍰he
   ergibt die Anzahl der Zeilen pro Seite.
5. Ausgabe einer/mehrerer Textzeilen auf dem Drucker mit
   v_gtext(handle, x, y, string);

jetzt passiert folgendes: - nachdem der Rechner ca. 167 Zeilen zum Drucker
geschickt hat, beginnt der Drucker bei Zeile
167 mit der Ausgabe, druckt dann aber alle
Zeilen ab Zeile 48...
... das verwirrt mich total.
Deshalb habe ich folgende Frage: Kann mir jemand eine Beschreibung schicken,
wie ich die Druckerausgabe richtig nutze, oder noch besser: kann mir
jemand einen Beispielquellcode schicken ?

mfg, markus

Any ideas?
>

You don't say which version of GCC you have, or what system you are using.
This make it just guesswork: (I assume you are running MiNT + XFS + a shell).

1. How much RAM do you have in your machine (GCC 2.5.8 & up likes 4 Meg).

2. Did you set the TEMP variable to a valid directory.

3. Did it ever work (ie. did you compile the version of Mint that you use).

I am not an expert, I was in the same position a few years ago.

You are supposed to use graf_mkstate() rather than vq_mouse() in a program which uses the AES - supposedly, GEM will get confused otherwise, which is what you seem to be experiencing.

```
     I'm currently having a strange behaviour with vq_mouse ...

     I've done a little drawing prg in C. It does:

      do
      {
     do
     {
       graf_mkstate(&x,&y,&b,&dummy)
     } while (b==0)                   ; loop while no mouse button is pressed

     ...                     ; draw a line to (x,y)

      } while (b!=LEFT_BUTTON)            ; exit if left button is pressed
```

Everything worked ok. But to speed up the process I decided to use vq_mouse instead of graf_mkstate. While I'm in the drawing loop it works OK but, when I release the RIGHT_BUTTON the system randomly returns that it's still pressed ! I put back graf_mkstate and the program returned to a normal behaviour. I'm using TOS4.03 on F030. Did someone already experienced that ? And is a cure available ?

At this moment I am looking at the source of Wolf3D. I downloaded this
sometime ago and have not had much time to myself lately:-(. But this
code is gonna take some porting if speed is an issue.

Sure, a straight C conversion would be reletively simple, but much of
the code would be better off DSPing, in order to show off the potential
of the Falcon.

Not a job for the faint of heart (or me for that matter!).

Gary

Hello,

I am writing the code for the dialer for the graphic NOS replacement (ICE).

I have completed the basic Dialer routine, but at the moment it is Demon specific. In order to make the dialer as flexible as possible I need to take a look at as many different NOS dial scripts as possible.

To this end, I would be grateful if people who do bit access the 'net via demon.co.uk could send me their DIAL.TXT file. Obviously you will want to keep your password secret, but I need to see where it is entered, so please replace your password with the releveant number of '*' characters, ie if you password is rover replace it with *****.

Thank you in advance for youyr help.

Can anyone please explain how to handle the window redrawing if the
window moved is the background window ? Which evnt_multi values are then
returned back ? I can't seem to find any info on that - and if I follow
the 'normal' window updating then the whole window gets redrawed.

What do you mean by the 'background' window? Do you mean a window which is not topped?

In any case, the correct procedure for window redrawing is as follows:
1) get rectangle from message pipe (the evnt_multi call)
2) intersect it with the screen rectangle (use wind_get with window handle 0, and its the work area you want... something like:

```
     wind_get (0, WF_WORKXYWH, &x, &y, &w, &h);
```

3) walk through window rectangle list and intersect each rectangle with the above rectangle (from 2). code should look something like:

```
     wind_get (your_window_handle, WF_FIRSTXYWH, &x, &y, &w, &h);
     while (w && h)
     {
          /* do the intersection here */
          /* do the drawing here */
          wind_get (your_window_handle, WF_NEXTXYWH, &x, &y, &w, &h);
   }
```

Hope this helps...

****
    Announcing the release of the STOS Falcon Extnesion (v1.1a)
****

You want to program your Falcon, yet you dont feel like taking on C or assembler? Well, you want the STOS Falcon Extension. This extension to the STOS programming language allows you to easily create Falcon only games / programs.

Commands include DSP replay of 4 track .MOD files, up to 32 track .DTM modules, Access to the Falcons sampling hardware, true colour sprites (with pixel perfect collision detection) hardware scrolling support and much more.

The extension is shareware, with a registration of 5 uk pounds. An un-registered version can be downloaded from various ftp sites (uploaded to incoming directories on 19/9/95) listed below:

micros.hensa.ac.uk
ftp.cnam.fr
ftp.un-kl.de
ftp.tu-berlin.de
ftp.cs.tu-berlin.de
ftp.stuttgart.de

A version can be downloaded via the WWW at the address given below.
For more information email me (Anthony Jacques) at:

jacquesa@cs.man.ac.uk

Won't objc_draw() work? Some versions of the AES can handle colour icons. For other AESes you have to write some PROGDEF code which does the same thing.

A good thing to check is Warwick Allison's AMS games programming
library in C++, if you'd like to do your programming in C (or GNU
C++).

If you have a decompiled resource, you can just make a mfdb with
the adress being the cic code of the desired cicon. Sounds confusing
doesn't it. Basically if you have a way to decompile your .rsc file, the
cicon blocks will be split up. Inside the new c file created (the one

that was the rsc file) you will find a litle table that points to cic001 etc. (or something close to that, I'm going from a very dodgy memory here). In your mfdb set the mfdb.fd_addr equal to this address. ie. cic001. Then blit it to the screen.

At least thats the way I do it so that older machines can use cicons.

How can I make a video adapter for the Falcon so I can connect it to the video in of my tv? Is it a simple matter of finding the correct 2 pins and routing them to an RCA plug? If so, do you know the pins? Thanks.

The Rsconf() function (xbios 15) configures the serial port, and when it comes to speed, Rsconf() can set the serial port to most speeds between 300 and 19200 bps. There is, however, no parameter for speeds between 9600 and 19200 bps. 14400 modem owners use 19200.

However, CoNnect has an option for 14400 bps in it's configuration. Can anyone tell me how this is done?

hi there
i am a desperate man - i would love 2 compile the vi editor for my atari st.
i am new to programming on the st and i have hisoft c compiler.
i need to get the unix-type c libraries for the atari st to do this.
i am sure someone somewhere has had a similar problem - can anyone
point me in the right direction please?
thanks a lot
     ian

Any library other than the gnulib has to be included explicitly. If you
want to link functions from the e.g portable math library, you have to tell
the linker with -lpml. The function you quote above looks as if from the GEM
department, with which I have no experience. I suggest you try -lgem and see
what happens. :-)

You'd need a bit of logic to select the icon of the correct colour depth,
but that would basically do the trick.

The only resource editor I know that can handle CICONs is Interface, which is
commercial.

VME vga card for ATARI MEGA STE???
How am I gonna do that, I allready have a card but it is ISA, are
there other ways to fit it into my computer? And what about the
software? NVDI et4000 or some shareware? Or is it really necessary
that I buy the VME card and NVDI et4000 from ACN in Holland?
That would be than about $300... a little expensive, than I'll better
wait for the mighty ATARI MICROBOX wich has the best
specifications I have ever seen!!!
And my memory, can I put normal 30 pins simms into the sockets
or do I need to by simms "specialy" made for that computer. For
the moment I have simms 4x1MB but I want to change them with
2x4MB can I just do that?

Welocme to Mnilu . .... Now at least Mnilu Tranquil ,GFA BASIC
'Compiler' is here for all you GFA BASIC coders. It's not the
official GFA compiler ,and nor can it replace the official compiler,
but it will enable everyone without a Compiler to turn their .BAS or .GFA
files into stand-alone .PRG files.

Mnilu Tranquil can be considerd the 'second' version of Mnilu.
It is by no mean the 'old' Mnilu with added support for GFA BASIC 3.5E,
but the GFA v2 compiler part has also had a _huge_ face lift.

Fully compitable with most GFA BASIC (v2 or v3.5e) files.

Mnilu Tranquil will soon be avaliable from the major Atari ftp-sites.
Or email to get back a UUEcoded version.

Please note that Mnilu Tranquil is postcardware.

Subject: Why wont these TTP's not run ?
Date: 1995/09/02
Message-ID: <428m46$43u@frisbee.damp.apana.org.au>#1/1
X-Deja-AN: 109415807
organization: Frisbee Internet, Adelaide Australia
keywords: Brocken progs
newsgroups: comp.sys.atari.programmer,comp.sys.atari.st,frisbee.atari
summary: These ttp 's I have wont load or run !

Greetings fellow Atarians !

I have a problem with a couple of old (circa 1988) ttp programs. The problem being that they wont run.
The two programs are parts of an algorithmic music system called Ravel. When I first tried to run them they would not start. I ran them again under Kaosdesk (gives better feedback on problems) and this told me that the progs were not executable. I then ran Knife st to check the disk etc and then ran the prog again under Knife using the run other program option. Knife then told me that the prog had an invalid program load format.

Now how, apart from data corruption, could this happen ? Is it something to do with old tos versus new tos ? I am running an Ste with tos 1.6. I would have thought that there shouldnt really be any backwards compatibility problems between tos's ? I have tried just about everything to get it to work even dearchived the originals again just incase something went wrong on the download but to no avail. The original archive was a tar.Z but I wouldnt think that would make much difference.

Can anyone help me with this ? I would really like to get it all up and running.

Many thanks in anticipation of excellent replies (by E-mail pref).

Have you got an /etc/resolv.conf? It looks something like:

domain domain.name
nameserver xx.xx.xx.xx

You can have more than one nameserver (and it's a good idea), but you can only belong to one domain. You must put IP addresses in the nameserver, because to resolve hostnames, you need a nameserver to resolve from!

: SO WHY DOESN'T ANYONE HAVE THE GUTS TO RESPOND TO MY QUESTIONS?

Lighten up, bobo. With an attitude like that, you won't get any answers.

I cannot get Chimera or DUFTP to work!!
First of all, every time I try to move Chimera around on the screen,
it jumps over to the right edge of the display, leaving me looking at
a few pixels of scroll bar. Also, any time I try to link to any document,
Chimera gives me a "cannot open html::<document name>" message.

WHAT AM I DOING WRONG????

I have a good PPP connection to the net, and I can use FTP.TTP to connect
to a site IF I GIVE THE IP ADDRESS, but if I give the name of the site,
no dice.

Also, DUFTP does not want to connect to any site I give it. It cannot locate
the site.

I suspect that my DNS is set up incorrectly, but have no idea how to set it
up. I have it pointed to the name server on my Internet host, but it does
not seem to want to look up the names.

I REITERATE: WHAT AM I DOING WRONG????

I have repeatedly posted these questions to all the pertainant
COMP.SYS.ATARI groups, with no help. COME ON PEOPLE, LET'S STICK TOGETHER!
I have answered other peoples questions to the best of my ability. I
know there are some people out there who are using Chimera successfully.
SO WHY DOESN'T ANYONE HAVE THE GUTS TO RESPOND TO MY QUESTIONS?
Any advice would be appreciated!

I'd really like to get on the Web, and I'd really like to to it on a
machine that does not have to have a personal blessing from Bill Gates
to boot, but with this level of non-support, even a long-time Atarian
like myself gets a little frustrated. And every one of us that leaves
hurts the community.

COME ON, SOMEBODY ANSWER ME!

I am looking to see if anyone has a fast optimised 256 color sprite handler, including masking with the background.

I am currently writing a game, and I dont think I can squeeze the speed out of Truecolor now (a real shame).

If you have some code for this and would be willing to share it with me, Id appreciate it. I could write it myself but I dont have the time or passion for bitplane screen modes..

Thanks for your help

Paul

Updated: 9/4/95

NOTE: A few things added, some sold, many prices dropped.
Enclosed is a list of the hardware and software that I am selling.
Please send me an e-mail if you are interested in something.
All prices are NEGOTIABLE.
You can contact me at:
     BBS: (412)343-1422
Internet: asmodeus@telerama.lm.com
     WWW: http://www.lm.com/~asmodeus/
  there is a link on my home page for the current list of atari items

All above prices do NOT include shipping, and will be dealt with on
an idividual basis per order. All prices are in US Dollars, and payment
is to be in US Funds. Money Order payments will be shipped the day
after I receive payment, and personal checks payments will be shipped when
the check clears.

ATARI HARDWARE FOR SALE
All harware is Negotionable in price.

Well if you look at TOWERS II, which runs at about 13-14 frames/sek., it should
be possible to make a reasonable result.

And Douglas Little from Black Scorpion Software claims that TOWERS II could be

optimized even more!

Why not? The speed advantage in assembler is brilliant, if one is good at it.

Anyone played around with vidi12st, the colour digi from rombo? I'm looking for a way to digitise in colour without having to resort to ST low rez on my TT. If anyone has the source code, I'd be interested to help get this project off the ground.

Simon

Hello,

Some time ago there was a thread about the double click bug. I hadn't encountered it, thought it was fixed in my TOS (4.02) and didn't pay much attention. Alas, as it is always the case, I now _did_ encounter the bug. I'm programming a GEM wordprocessor with the EnhancedGEM libs, and when I click on an arrow or page down the slider, the event gets sent twice. I remembered that an empty timer event (i.e. Event_Timer (0, 0)) _before_ the `real' Event_Multi (NULL) would solve it, but it doesn't.

I know I can use ArrowFix, but if there's a way to solve it in my program, that's preferred.

So how was that again?

Thanks in advance,

Towers II uses a _very_ much simpler 3D model than DOOM.
IIRC there are no angled walls, everything is on one level, there are no
windows/stairs/platforms and the visibility is very restricted.

>And Douglas Little from Black Scorpion Software claims that TOWERS II could be
optimized even more!

I really hope so or MOOD (a suggested working name that may change) will
not have much chance, at least not with any texturing. We'll very likely
have to cut down the horizontal resolution by half in any case.

And from another article (Martijn Dekker below):
>> ok, but please do not over estimate the advantage of assembly over C...

> Why not? The speed advantage in assembler is brilliant, if one is good at it.

Only if you do specialized stuff like graphics (or something else that
needs bit-fiddling) or if you use a crappy C compiler, which unfortunately
is just about everything but GCC for the Atari computers.
Granted TurboC/PureC can produce decent code, but that requires that you
optimize your C code since the compiler in itself does next to no
optimization. (Lattice is quite good at optimization, but for some reason
it often screws it up. I've had non-optimized code run quicker than

optimized a couple of times...)

In a program such as MOOD a great deal of time is spent trying to figure out what walls should be drawn and where, which requires a lot of data structure manipulation. That's something that a good compiler is normally quite capable of handling.

That said, there might be a factor of two or so of improvement by simply rewriting everything in assembler.
You're quite welcome to take a shot at it. All the C sources for DVIEW are in the archive at the site mentioned in my .signature.

I do believe this to be a case where the DSP will really shine, though.

Does anybody know how to program Microdeal's Video Master on an STE?

I want to digitize frames, and store as either single pictures or as
animation sequences.
Preferably in GFAbasic or assembler.

realism? in doom?

I don't care about realism in games, realism enough in real life.

Very funny!
No, with enough configuration options, it could be done on a ST, by getting
rid of the textures. But a falcon version with all the textures would be great
and EASY to do, since we've got the sources.
But be careful, you would still need iD's authorization, and it would have to
be free. Read the license agreement.

Bye.

About doom: why not first try a wolfenstein engine that uses the levels of the
pc wolfenstein? iD software has made the sources of wolfenstein public!
I only have a 1Mb 1040STfm, mono monitor, but I maybe I will try to make
a wolf port to X Windows...

I would love to see Wolf 3D for the Falcon. Would someone please
consider doing this? :-) I do think that the Falcon can handle a
Doom-like game but I'd like to see a good, fast-action 1st-person game
come out on the Falcon ASAP.
BTW, Substation is a fun game, IMHO, although my first impression of
it was bad.

: realism? in doom?

: I don't care about realism in games, realism enough in real life.

Realism isn't necessarily about immitating real life. It's more about
the game transporting you into its world and making you feel a part of it,
rather than making you feel simply like you're playing a game.

: Meg - I have never tried these though (Not a problem as I have 4 MB)

Heh :). One can run them, but compiling anything bigger than 'hello world' will need much more memory. And if you'll intend to optimize sources including _big_ functions, you'll certainly need more memory (GCC 2.5.8 needed 3.4MB free RAM to compile old XAnim version (one 1000 line function...)). Using G++ with lots of classes needs lots more memory and is IMHO unusably slow on a plain ST.

There are almost no similarities between the two, so it would hardly be
worth the effort.

>no, do not get rid of the textures. There is no game left after that (same
>holds for doom).

Why do you say that? Sure the textures makes the games look nicer, but
the _game_ would still be the same without them.
Have you looked at DVIEW (in 'f'/'w' mode)? I think it shows very well
that a DOOM without textures can look quite good. In TC mode with some
light shading it'll look even better.

>of course it should be free, that is no problem is it?

Not for us, but then we won't do it either.
For some reason many (most?) people who spend some serious amount of time
on a programming project do expect others to pay.

It is worth the effort: when wolf (with textures and all bells and whistles)
is slow, forget doom. If it is very fast, maybe doom will work.

Hi, I realize the Atari ST is rather outdated, and that anything programmed in STOS won't have a vast market, however I have never done any programming before and would like to attempt some simple things for myself. I'd like to know how to get started with STOS, which I assume is the easiest programming language. Are there any books for complete beginners?

newsgroups: comp.sys.atari.programmer

I am trying to make an application I am writing use the facility for
SpeedoGDOS fonts in dialogues under AES 4.1.

I have set te_font to 0, te_fontid to a valid font id for a outline font,
and te_size to 10 (for 10 point.)

However, where the text object is, nothing at all gets drawn after
calling objc_draw().

This is under NVDI 3.01. I do not have SpeedoGDOS 4.2 so as to see if it
will work like this.

Also, the environmental variables to do with the system font (ae_fonid,
and ae_fonsize?) seem to have no effect. It says "Loading GDOS Fonts" as
AES 4.1 starts up, but the system font remains just the same.

Any help would be appreciated.

Hi

STOS is indeed a very old package. Last I remember STFORMAT still offers
the set in one way or the other.

The manual of STOS should give you very good startup guide for beginners,
also check out the archives on the net for STOS programs and samples.

Cheers

Yat

As I remember it, you have to wait (once per application) for a doubleclick.
(NOT the negative doubleclick that is used to detect left or right button,
a NORMAL doubleclick). Waiting for a doubleclick ONCE per program is supposed
to get rid of the bug. Of course, you don't want to force the user to
doubleclick something every time the program gets started, so you combine the
wait for a doubleclick with an empty timer event (i.e. you put them together
in an event-multi).

Hi all,

(Sorry if this is the wrong newsgroup, but the .tech group seems
to be gone here.)

I got a Megafile-30 hard disk (and no atari computer), and I'm
wondering if I can use the disk with some other system, e.g. some
PC, or even my CP/M system (that needs a SASI disk).

Questions:
What is the DMA-bus that connects the disk to the computer?

What protocol runs on this bus?
Does it look like SASI, SCSI, or something else?
If I take the Megafile-30 apart, can I use the drive with a standard RLL disk controller on a PC?

Thanks.

Paul

Well, I figured out what I was doing wrong. I had used the environment
variable RESOLV_CONF_FILE (I believe that's the name, I'm not at my
computer at this time so I cannot look it up) to relocate the
resolver config. file from u:/etc/resolv.conf to c:/mintnet/resolv.cnf.
Unfortunately, either the resolver wasn't paying attention to the variable
or the variable was being set after the drivers were loaded by MiNT. Result:
No config. file (as far as the resolver was concerned) and therefor no
nameserver.
I put the file in /etc/resolv.conf and all was well.

Thanks for everybodies help.

Hi,

I am having trouble with keyboard interrupts...

I have installed a new interrupt to read the keyboard and joysticks, which works fine on its own, but when combined with a timer B interrupt (eg. border removal on an STe & DSP mod-player on a Falcon) the ACIA will occasionally lock up (ACIA control: $fffc00.b = %10100011).
Can anyone suggest a method for avoiding the overrun error or a method to reset the ACIA?

Thanks,
Yiannis

There is also a book by Stephen Hill (author of original STOS manual),
called 'The Game Makers Manual' which describes how to go about writing
games in STOS, covering lots of different game types. Its not that great,
but covers the basics, and may help to get you started...

The STOS mailing list can be joined by emailing
     stos-request@man.ac.uk
with the following line in the body of the mail:
     subscribe stos me@some.host
where me@some.host is your email address.

subscription may be a little slow for the next two weeks, as I am not around
to subscribe you (alhough I have limited access from here).

Towers II has vertically angled walls that cut across squares on some of the top levels - the mine area with the dead mages and warriors of the council in it, just below the top couple of levels.

The point of doom is less the angled walls and staircases etc and more the mindless violence in a nice textured environment. Lasers & Men could be adapted to make a fine Doom clone - maybe not up to the original, but still fun. Not having to run two inteligent teams of warriors, just simple targets close to the player should free up some speed as well.

I've seen enough demos and games already on the Falcon to be certain that a Doom clone is very possible. Not that I'd like to try and code one.

It returns 256 in the number of *pens* available for the VDI, not the number of planes. The VDI only has a maximum of 256 pens, even in 15, 16 and 24 bits-per-pixel modes. There is another value in the array returned by vq_extnd which gives the number of planes.

Well, without counting the DSP that might be a reasonable comparison.
_If_, however, we manage to get the complete rendering engine (code and map) into the DSP RAM (which does seem likely) it should be possible to get quite a bit better DOOM performance than a 16MHz 386SX.

>graphics and light sourcing is hardly worth playing. Doom without the

Scrolling? I guess you mean the update frequency, which is of course important, but from experience playing DOOM and AvP on my Jaguar, I'd say that around 10fps would be acceptable. I must admit I'm still not 100% sure we can reach that for more complex surroundings.

Tests I've done with DVIEW has convinced me that a non-textured DOOM can look rather good, even without floors/ceilings.
Lighting effects will likely be quite simple to add when TC mode is used.

>music and sound effects just isn't Doom. We're trying to do Doom without
>either of those aspects?? Sounds like a pipe dream.

The Jaguar version of DOOM has no music and I always turned it off when I played the game on a PC. The sound effects, though, are probably

necessary, but should also be easy to do. If the sound DMA matrix is used
up for the level graphics communications, we could always fall back on the
STE DMA sound.

As of Monday 21/8/95 OASIS 1.30E has been uploaded to the Demon and Hensa FTP sites.

Two files have been uploaded.

OASIS130.TOS is a complete version of OASIS for people who have either never installed OASIS before or who have a version of OASIS below 1.20E.

UPD_130.TOS is the files that have changed from version 1.20E for those who have already installed 1.20E.

summary: Atari ST Hardware and Software for sale
organization: Telerama Public Access Internet, Pittsburgh, PA
keywords: atari, st, for sale, sale, software, hardware
newsgroups:
comp.sys.atari,comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.st.tech,
misc.forsale.computers,misc.forsale.computers.other.systems,misc.forsale.computers
.other.software,pa.forsale,pgh.forsale,pitt.forsale,us.forsale.computers

Most software has original boxes and documentation.
All software are original disks, not back-ups or copies.
Some of the hardware also has the boxes that they came in,
but some do not, such as the hard drives, disk drives for parts,
1040 case and RF shield, etc.

All prices are in US Dollars and do not include Shipping costs.
All prices are negotiable and open to reasonable offers.
Payment by personal check will be shipped after the check clears
my bank, aprox. 5 working days. Payments by money orders will be
shipped the day after payment is received.
Priority will be given to orders of 5 or more items.
This list current as of: 8/20/95

Item Name starting with (P) is possibly sold, in negotiations,
or awaiting payment.

ATARI HARDWARE FOR SALE:

ASKING PRICE	ITEM NAME
$350.00	1040 ST/F 4megs mem., tos2.06 TEC board, ADspeed 16mhz upgrade.
$175.00	1040 ST/F(M?) 1meg memory MIGHT BE 520
$350.00	1040 STE 4megs mem.
$125.00	Color Monitors Atari brands
$125.00	Color Monitors Atari brands
$25.00	(P)Color Monitors Atari brands (broken, power box)
$90.00	SM124 Mono Monitor
$80.00	(P) Indus GT External 720k Floppy
$25.00	The BEst TrackBall
$35.00	The Cordless Mouse (Practical Solutions)
$300.00	Toadfile 130meg + 80meg HD w/ICD+ host

$160.00	ShoeBox 80meg HD w/ICD+ host
$110.00	20meg shoebox, atari adapter
$20.00	Mouse Master
$15.00	Monitor Master(toad brand?)
$30.00	Video Key
$15.00	ST Video Digitizer
$110.00	The Complete Colour Solution (Vidi-ST, Vidi-RGB and VidiChrome ST)
$100.00	Stereo Replay audio digitizer
$35.00	ST Sound Digitizer (Hippopotamaus)

I'm looking for a decompression utility for files packed with Automation
Packer v2.3r. Preferably it should run on a 520STFM or Macintosh. Can
anybody help?

In DB Master, the ascii delimited output is in the form of a report. DBMaster breaks the entries with CRLF, but you should be able to find a program that converts the carriage-return,line-feed to comma if you need to. Or your PC program might be able to perform that as part of its import function.

Let us know how this turns out, please

I am looking for information about the SCC chip and how to program it directly. I know there are several patches but I really _need_ to write my own routines. If anybody can help me please do it!

Thanks in advance!

If you can read German, there is the excellent "Atari ST/STE/TT
Profibuch" which describes quite a bit of the SCC programming. I'll
look up the ISBN if you are interested.

In my mind the best and simplest way is to get sources of linux routines
for SCC devices. You can get a lot of info from those sources. I
recommend you to get sources of 0.9.10 kernel (or newer if av.) from
tsx-11.mit.edu://pub/linux/680x0/src.

Folks,
Im looking for a copy of a program called Xmon for the Atari.
It is a screen driver for a Moniterm 19" monitor (SM194). Apparently
it was written by Doug Wheeler (Ex "Code Head" programmer). Any one
know where I may be able to get a copy of this program?
Alternatively any one know what/where drivers are available for the
19" mono monitors. My friend (whom I'm requesting this for) is currently
running bigmon. He's had a few problems with this and was advised to get
xmon. Any differances??? Comments??

Thanks,

David

Subject: compiling FreeMiNT with Pure C
Date: 1995/08/25
Message-ID: <41kc2e$oj8@wn1.sci.kun.nl>#1/1
X-Deja-AN: 108833189
organization: University of Nijmegen, The Netherlands
newsgroups: comp.sys.atari.programmer

Hello,

The last few days I've been trying to compile FreeMiNT 1.12.4 with
Pure C. It won't work. After some time I did get it to compile and
link (which even involved altering the source in some places) but the
program isn't stable. When running it with MultiTOS, I have to press
^C during boot (otherwise the AES copyright message stays on screen
and blocks the computer) and I get error messages all over. Without
MultiTOS (which was why I compiled it myself in the first place!) it's
even worse. The GEM screen stays white, and after pressing ^C
(nothing else seems to work) I get errors again.

Could someone who did manage to compile a stable MiNT with Pure C
please tell me what I'm doing wrong? Or, as an alternative, could
some kind GCC-owner uumail me a MiNT kernel compiled with ONLY030 and
without FASTTEXT? (Or upload one, as the latter switch prevents
MiNT from working stable in a BlowUP-equipped Falcon).
-DMULTITOS should work without GEM.SYS too, right? The swich just

enables _trying_ to load GEM.SYS?

I'm getting pretty desperate. I mean, I _had_ a perfect working environment on my old ST (MiNT 0.96 or something, worked great, even with OverScan!) and now on my Falcon, I can't get an ordinary pure MiNT to work! It's driving me crazy!

And please don't say `install GCC' as my HD is filled to the last byte. Gotta get a new one some day.

P.S. How did you get on the MiNT-mailing list again?

Regards,

Hi, and welcome to Ch.A.O.S. Country. Welcome to the revolution. The Cheyenne Area Orphaned Systems, or Ch.A.O.S., is a club devoted solely for the preservation of classic non-IBM systems, such as ours, and for the defeat of Microsoft. If we wanted IB
M compatability, we would have abandoned our systems long ago. Those of us who do have IBMs, but still use our classics, only bought them out of necessity, such as for work or school.··This is not a political organization. We do not hold any specific r
ight wing or left wing political views. We do believe in fair competition and Microsoft is NOT fair. We spent all that time and money on our respective systems because the performed the task or tasks we bought them for. Wether it be for gaming, educat
ion, office, or whatever, our classic systems performed upto our expectations, and in some cases, beyond the original design. Why should we abandoned everything we put into our systems?··I have been working on the designs of two programs that I feel wou
ld unite all of our systems, yet retain the sovereignty or flavor of each individual system:··1. A terminal shell with game maker to allow two or more non-compatable systems to play games over the modem or in a mini-network. Of course, standard protoco

ls will have to be set between computers to ensure game play. But, graphics between two different systems wont have to be the same because screen data wont be sent, just tiny info packets. The games would take full advantage of the graphics and sound c
apabilities of each individual system. The games would be played as close to real time as possible.►►2. A DEVICE OPERATING SYSTEM (DOS) desgined on a bi-level format: The primary level is a whole new computer that provides cross-platform compatability
 between our classic systems. The computer will be based on the PowerPC. This will allow each classic system to be enhanced to that of at least a 486. Without losing much compatability with the existing sytems. Full compatability is not guaranteed be
cause of the new enhancements to each individual operating system. But, at least you wont have to abandon your whole classic system! The secondary level is a whole new disk operating system for the original classic. This will allow direct disk access
communication between ALL systems. Yes, even IBM. Just imagine, a C64 computer operating system with 38k free RAM, can now have as much as 3.75 Meg free RAM on a 4 Meg System! This is directly accessable without bankswitching or even use as a RAMDISK!
  Just imagine the fresh, new applications that can be developed that retained the original C64s flavor. No, this is not limited to the C64, but to all classic systems, such as the Atari, Tandy CoCo, VIC20 (YES!), Apple, etc.►►All of our classic systems
 have their own uniqueness, their own distinctiveness. That is why we refused to follow the industry or marketing trends. This would allow us to preserve our systems and at the same time develop a cross-platform industry standard. Who says we have to
follow the Microsoft standard? Lets follow a standard, sure, but we should also be allowed to keep our systems we have devoted so much time and energy into!

I hope Julian Reschke, nox, knarf and the like join the TOS 5 team.
We could have a `TOS 95' that beats every other OS then :-)

Oh I _hope_ some of these guys follow Eric Smith's example, quit the
jobs they're doing now and deliver a shiny new TOS next month.

Can't wait.

Hi,
        I am in the middle of writing a disk error correction
program and I am trying to find information on the location of the
FAT and how it is formatted.
        Does anyone know if there is a HiSoft Power Basic
(smaller version of HiSoft BASIC) command or library function that
may help and how it may be used?

 Any help will be greatfully recieved.

        Thanks in advance!

        Chris.

Does anybody know how to read the falcon joypad? I tried to use the routine found in falclib but when it tries to write $FFEE at the address $FF9202, a bus error always occurs. The code is:

```
 move.w #$ffee,d0
 move.w d0,$ff9202
```

My joypad works correctly with the games that use it (e.g. sbm) so that's not the problem. I use Pure C 1.1. I really can't figure where the problem comes from.

Thanks for posting any suggestion.

The Mega-Depack program will do the job for you no problem.
If it's an auto-depack file then just load it up into MonST
and find the jmp (a6) instruction at the right place, put in
a breakpoint and there you go.
Hell, even if it doesn't have the depack routine in it, just
grab it from another file and use that one instead.

Gaz

Maybe someone's ported the GNU compiler set for the ST. I know there's a port for DOS machines.

If there is a port it's not a particularly good C++ compiler as it doesn't implement templates correctly (at least the NeXTSTEP version doesn't). The Objective-C compiler seems to be easier to use (and it's faster to compile).

I also remember that Calamus seemed to be written in Turbo C. Maybe Borland produced a C++ version later on?

Data are written at some address I can't remember, in the mode "handshaking", that is, the 68030 only writes a data if the buffer is empty (The DSP has red it). So, the 68030 is busy during the whole transmission.
On the other side, the DSP can be interrupted during its execution (the $40 1st word of the P-memory contain interrupt vectors).

When you transfer some data to the dsp (using dspblk_words() or whatever)
is this taken over by an interupt so your own program can do something else
until all the data is collected ?

Or is it the other way around - your program waits until all the data is
transferred, then carries on ?

Cheers,
Phil.

Try getting ehanced egem libraries, they make programming under GEM
easier, but unfrotuantely I'm sure I've found a bug in the source somewhere
that make it not work when you don't have speedo installed...

anyway, get the source distribution kitt from somewhere for the complete
gnu package.. (try ftp.cnam.fr)

This apparently is quite common with C++ compilers. My brand new copy of
MS VC++ 1.5X doesn't implement them either AFAICT.

This all seems to be due to the C++ standard not being properly defined
yet - as oppsed to any lazyness by compiler writers.

All IMHO and AFAIK.

:-)

Roland.

Yeah, there is glorious GEM object oriented library called GEM++. The way you can create your GEM application with this library is unbelively easy. You can find archive at ftp.cnam.fr://pub/Atari/Programming/gem++19.zoo

> Thanks!

Welcome one more GEM++ programmer!

regards,

Simon.

I don't know of those two books: It may refer to the `Compute' GEM guides, which are very good (lots of examples), but I think no longer available.

Probably your best bet is `The Atari Compendium' by Sanders, which has lots of other extremely useful stuff in it, as well as AES & VDI (it's also up to date on GDOS, etc.). In the UK, it should still be available from HiSoft.

Both ST Applications and ST Review magazines ran series a while ago which introduced the basics of GEM programming. You may be able to get back copies. The ST Applications `Programmer's Forum' pages occasionally print whole listings of simple GEM programs, which you should be able to pick up a lot on.

On the net, there is the `Professional GEM' series of articles by Tim Oren. They are good, but a little dated now. Available on atari.archive in a number of different formats.

Failing all those, I have an extremely bad book, the Abacus GEM programmers guide. I would give it away, except that it has so many typos and outright mistakes in it, I wouldn't want anyone to learn GEM programming that way.

I'm writing this small announcement that from tommorow 1st September my current email address msh@dl.ac.uk will no longer be vaild and that you should use my new and permanent email address dlms@nessie.mcc.ac.uk. Please also note that I'm going to be off the net for a few weeks until roughly the 25th of September so please be patient if you write to my new address and don't get an answer.

I will deal with all mail when I return and and will clear the 40+ backlog I have at the time of writing this.

Whilst I'm away the Atari Web pages will obviously have a bit of a holiday, but believe me it will be under a major set of revisions, improvements and additions when I return as I have tons of updates just waiting to be included and I'm designed graphics to improve it's appearance.

See you all in just over three weeks. Take care!

There are TOS versions I agree - but 2MB memory would be extreamly tight.
I used to have trouble running plain old GCC 1.23 in 2.5Mb with a hard
disk. Somewhere there is a distribution for GCC 1.3X which runs in 2.5Mb
off floppies - however never saw one which could run in 2Mb with a hard disk
or in 1MB at all.

I know the query was about G++, but as thats larger than GCC - the memory
requirements are not going to be any less.

All AFAIK and IMHO,

:-)

Roland.

 It should be pointed out that GNU C++ can be run on any ST with TOS
and (I think) 2 Meg or more of ram. Earlier versions might run on 1
Meg - I have never tried these though (Not a problem as I have 4 MB)

Oh - and a hard drive is pretty much essential for later versions. I
see you are in England Dave - try the ST Club - they have a couple of
versions in their catalogue, one of which might run off of floppy.

I was just curious if anything came out of the talks of porting Doom
to the Falcon. A monthly update would be very nice, if possible.
I'd really like to see this game happen (and I think the Falcon
is up to doing it).

Well, so far what's been done is mostly very preliminary work.
I've ported DVIEW, an interactive 3D .WAD viewer from the PC (available
by WWW/ftp, see .sig), but AFAIK that's the only code that's been
written. Quite a bit of information has been gathered, though.

For the past few weeks, I haven't had the time to do anything on the
project and I've not heard from the other people involved (I believe
they're on vacation).

>I'd really like to see this game happen (and I think the Falcon

Well, the possibilities for that are perhaps not too bad, since we
intend to make this a free project, likely along the GPL lines. At least
that was the case when I last exchanged email with the others and I'd
not like it to be otherwise. That means that the sources will probably be
freely available, as the DVIEW ones are right now.
(If anyone has any ideas for improvements, I'm all ears.)

>is up to doing it).

That remains to be seen, but I have high hopes that _something_ usable
will at least be possible. The current DVIEW version only reaches around
2 fps on a Falcon, without texture mapping at 320x200, but then it's still
written in C and could hopefully be optimized quite a bit. If the problems
with DVIEW can be sorted out, the DSP would certainly help...

It's too early now to give any seriously interesting news about the project.
But the project exists and good wills are still welcome.
And there are legal issues to settle: we'll have to contact iD software
because a program that could read WAD files is theoretically illegal unless
it's a WAD editor or something like that.
But the program will be totally free and anyway it will need iD's registered
DOOM or DOOM 2 WAD. The reason for this is that most WAD files are just
patches of the original WAD.
So people who want to play _legally_ on the falcon will have either to limit
themselves to the shareware version of the DOOM WAD, or to purchase their

registered DOOM from iD.
So this should just enlarge the market of iD and cause them no harm.
I'll give news of the advancement of the project whenever there is a
significant progress.
NB Some other people are working on DOOM like games. Perhaps they could give
some news of the advancement of their project?

2 fps? no textures? I guess no dsp? well... This is not very promising.
Maybe you'll end up with 5 fps + textures, using dsp. if you are lucky...

No no. this 2fps is just due to the fact that this is just a direct conversion
of a C program for the PC. So it can give almost no clue about the speed of
the real program which will be assembly language and will use the DSP.
This is a preliminary work, as Johan pointed out.

X-Deja-AN: 107978142
reply-to: chris@georgianho.win-uk.net (Christopher Croft-White)
newsgroups: comp.sys.atari.programmer

Hi,

I have recently started to program in GFA Basic V 2.0 and have
found it to be a very powerful language. However I have a few
questions which I would like help with:-

1) Is there a command and if so what is it, to produce a GEM
   select box?

2) In the manual I have it explains the function EXEC as:

EXEC
How: EXEC flg,name,cmd,env
Use: Loads and executes machine code programs or compiled
      programs from disc.
      flg=0 load and go flg=3 load only.

```
       'name'   - the name of the program.
       'cmd'    - command line (see BASEPAGE).
       'env'    - environment string (usually just "").
        The named program is loaded from disc, the absolute
        addresses are relocated, a basepage is created, and if
        required, the program run.
```

And when I checked BASEPAGE, it said:-

```
BASEPAGE
How:    BASEPAGE
use:    Returns the address of GFA Basics basepage.
```

That helps! :)

Does anyone know what the command line variable is and could give an example of the function in use?

3) I have the mnilu compiler V 1.61 and would like to know if this function will compile as in the help text it states that no links are possible?

4) I only have the manual text file which came on the ST Format cover disk. Does anyone know if there is a better manual file and if so where can I FTP it from?

TIA!

Chris.

P.S. I fould the mnilu compiler V 1.61 at:-
http://src.doc,ic.ac.uk/packages/atari/umich/Programming/Gfa/mnilu.lzh
Does anyone know if a newer one exists for GFA basic Version 2 and where I can find it?

IIRC, you have to put an event-multi call at the start of your program:
The call should wait for doubleclick (so it cures the bug) and for
0 miliseconds (so it doesn't slow down program start-up).

Note that there is no need to put this call into any kind of loop. A single
call upon startup of the program should suffice.

Was GFA 3.7 for the Atari ever actually released? If so, what new features
did it have over 3.5/3.6? I've never seen this version in the US.

: >

: I upgraded the ROMS on my MEGA 4ST a long time ago (four years) and I
: had to change from a 6 to 2 ROM chip set, to do so I had to remove a chip from
: this area of the board. I know this sounds a bit vague, but it might help.
:

Well this 74LS11 does an AND operation to the /CS-lines for the three ROM areas. There are two jumpers (0Ohm resistors normally) on the board which select operation with megabit-ROMs (2 ROMs) or 256Kbit ROMs (6 ROMs). Normally the chip isn't needed when you have 6 ROMs since the GLUE generates the needed signals then. To make it clear: The chip doesn't disturb operation for all three possible configurations (boot roms, 2 ROMs, 6 ROMs) and can always be stuffed...

RE finding the name of the program from the command line:
  A. Unless the program is called via argvspec protocol, there is no way to find the name of the program, using 'legal' methods in any language.
  If peekb(basepage+128) = 127 then
     search the environment directly for the string starting "ARGV="
NOTE the strings are 0 terminated and contiqous. Now set the byte containing 'A' to 0, terminating the environment. and advance past the string that did start with ARGV=. The arguments are 0 terminated strings in order the first being the name of the program, the second the first argument, etc. the list of strings ends with a double 0, that is an empty string. Have fun in basic.
   if peekb(basepage+128) <> 127 or ARGV= is not found then argvspec is not used.
   I think this is the shortest description of argvspec I have seen.

Hello,

does anybody know how to draw thick dashed lines with the VDI?
I tried it with NOVA-VDI, MagiC-VDI, Atari-VDI and NVDI. None of them managed to do it.

Is something wrong with the following code:

```
vsl_type(handle, 3);
vsl_width(handle,5);
v_pline(handle,....)
```

Thanks in advance

Thomas

newsgroups: comp.sys.atari.programmer

Hello everybody,

I have a problem getting GCC and GNUmake running
on my machine. This is my configuration:

TT, 4+4 MB, runs in 1280x960 mono
MagiC 3.0, NVDI 3.01, Gemini 1.A

Free ST-RAM: 2.650.190 Bytes
Free TT-RAM: 2.995.626 Bytes

FIRST PROBLEM: GCC

GCC is installed on an own partition (k:), including
the required directories (bin, include, g++inc, lib).
The compiler itself can be found under \bin\gcc-cc1.ttp
and - for C++ - under \bin\gcc-cc1p.ttp

Environment variables are set in MAGIX.INF according
to the README file (GCC_EXEC_PREFIX etc.). I've also
included k:\bin as path for executable files (PATH).

In k:\work there are my current workfiles, i.e. at

the moment the only one is hello.c :

```
#include <stdio.h>

void main (void)
{
  printf ("\nHallo Welt, ich bin da!\n");
}
```

BEHAVIOUR (in Mupfel) :
---

1) Start with "gcc hello.c"
   There doesn't seem to happen anything. There also
   isn't any error message.

2) Start with "gcc"
   I get the message "gcc: no input files"

3) Start with "k:\bin\gcc-cc1p.ttp"
   The compiler starts and immediately throws out an error message
   for line 1 (#include <stdio.h>): "undefined or invalid # directive"

HOW DO I GET THIS F...ING PROGRAM COMPILED?

SECOND PROBLEM: GNU MAKE

GNU make can be found on the same partition (K:) in the
directory /make. If I start make, I get the message
"make: not enough memory".

Is this possible? Are about 3 MB of remaining TT-RAM not
enough to get make running?

HELP!

Christoph

I've been doing a bit of reading up on the DSP56001 and I'm now a bit puzzled.

As far as I can see, the DSP will only perform arithmetic on fractional numbers. Now, I can see how to convert integers or real numbers to this format but I cant't see how calculations performed on these numbers would yield the correct result when re-converted.

Any ideas?

Thanks in advance

Gary

Thanks. Your explanation wasn't quite correct, but it was enough so that I
managed to fix the problem.

The solution is to change the evnt_multi() that drives the entire GEM program.
You basically change the number of button clicks to 2, and add the MU_BUTTON
mask to make evnt_multi() look for double clicks. Then ignore any events which
have the MU_BUTTON bit flag set upon return from evnt_multi().

I'm afraid your're wrong here. In MEGA-STs, one of the jumpers has only one position (that's the two pads with the longer distance beside ther LS11). If you want to use that setting (for 6 ROMs), you have to either remove the LS11 or cut one pin at that part - otherwise you have two outputs connected together.

The easiest solution is to put in a socket ... put in the LS11 for 2-ROM operation, remove it for 6 ROMs.

The VDI doesn't support dashed lines thicker than 1 pixel. It's as simple
as that. :-(

Cheers,
    Simon

path   = path to set the file selector to (*)
filespec= file spec to place in the filename box (usually "*.*")
title   = (TOS 1.4 and up only) Title to place at the top of the selector

(*) ALWAYS INCLUDE A PATH! Faliure to do so will cause file selectors on
    TOS 1.2 and below to sieze up unless users are using an alternate file
    selector. To set to the current path, set path to DIR$(0)

: 2) In the manual I have it explains the function EXEC as:

```
: EXEC
: How:   EXEC flg,name,cmd,env
: Use:   Loads and executes machine code programs or compiled
:        programs from disc.
:        flg=0   load and go     flg=3   load only.
:        'name'   - the name of the program.
:        'cmd'    - command line (see BASEPAGE).
:        'env'    - environment string (usually just "").
:         The named program is loaded from disc, the absolute
:         addresses are relocated, a basepage is created, and if
:         required, the program run.
```

:   And when I checked BASEPAGE, it said:-

: BASEPAGE

: How: BASEPAGE
: use: Returns the address of GFA Basics basepage.

:   That helps! :)

:   Does anyone know what the command line variable is and
:   could give an example of the function in use?

When it says "command line" that is where you place whatever parameters you want there, usually for .TTP files. i.e. If you wanted to EXEC LHARC.TTP to extract "DATA.LZH" you'd do this (after properly reserving memory for the application):

```
EXEC 0,"LHARC.TTP","-x DATA.LZH" ,""
```

THe environment string usually never has to be changed unless the program you are calling requires there to be an environment variable set. Figlet is one example; usually, users of alternate desktops or TOS 1.4 and up can set their environment variables and save them to their DESKTOP.INF/NEWDESK.INF file. But if you wanted to call FIGLET for example, with the FIGLETFONTS environment variable set, you'd probably do something like this:

```
EXEC 0,"FIGLET.TTP","-f colossal.flf > text.fig","FIGLETFONTS=C:\figfont"
```

: 3) I have the mnilu compiler V 1.61 and would like to know if this
:   function will compile as in the help text it states that no
:   links are possible?

I think by that he means no INLINEs. I could bd wrong, though.

: 4) I only have the manual text file which came on the ST Format
:   cover disk. Does anyone know if there is a better manual
:   file and if so where can I FTP it from?

:   TIA!
:
:   Chris.

: P.S.   I fould the mnilu compiler V 1.61 at:-
: http://src.doc,ic.ac.uk/packages/atari/umich/Programming/Gfa/mnilu.lzh
:   Does anyone know if a newer one exists for GFA basic
:   Version 2 and where I can find it?

I am trying to spawn a TPP program from a GEM program in MagiC. The programmer's guide stated that the child program can be running in parallel to the parent program and also the TOS (& TPP ?) program spawned can be in a window. This can be achieved using shel_write(). However, when I checked the system using appl_getinfo(), I found that the shel_write cannot execute program in parallel. I also verified that MagiC is in multitasking mode (again using appl_getinfo()) when the main GEM program is running. Is there something that I should set in MagiC so that the shel_write() will execute program in parallel ?

Regards
William

Well, I think the Atari Desktop suffers from the same problem, but I did see something posted in news a while back that I clipped that might be of help. I don't know the accuracy of any of this, but I included the entire thing as is.

I believe the solution to the infamous 'double click bug' is to arrange a timer event of length 0. Since the length is 0, it does not delay your program: but somehow it rectifies this rather annoying bug.

I think it's just a simple evnt_timer(0) call.

No, except most drivers (as you've discovered) will not honour the
dash setting. You can find out if a driver will or won't do this by
looking at one of the vq_extnd() return values.

Well, since Id software has recently released the complete sources for
Wolf3D that might really show up. There's a readme file with a lengthy
legal statement, though, which I've not read, but at least a 100% Wolf3D
could happen.

>that it hasn't seen the light of day. But we do know a lot about
>how DOOM works and I'm prepared to answer any queries as well as
>I can given the strictures of the NDA.

You'll definitely hear from me later...

I'll soon (tonight) upload a new version of my port of the interactive
3D DOOM .WAD viewer DVIEW to my www/ftp site (see .signature). There's
(of course) no texture mapping and on a normal Falcon it still only runs
at around two frames/s in 320x200. The C sources (and original C++) are
included, so everyone can help improve it, though. ;-)
The sources look quite ugly since I've added quite a lot of test stuff
and am trying a few different algorithms, but with a bit of thought
most of it should be understandable.

At the moment it seems likely that this program will be used as the base
for the attempt at a DOOM .WAD compatible game for the Falcon.

By the way, I did not bother compiling the program to run on processors
<68020, but it should compile nicely under both GCC and TurboC/PureC if
anyone wants to give it a try.

Rich,

The reason you have probably not been informed is that, as far as I know,
the English version of MagiC 3 will not be released until it is ready for
the Falcon, unlike the German ST/TT version which was made available before.
I spoke to System Solutions in the UK three weeks ago, who said that it
would be at least another month (i.e. probably two or three!) before we saw
the likes of MagiC 3 and the HD-Driver version with background DMA support.

Cheers,

Richard.

Hello,

A friend of mine is currently using an Atari ST 520. He is
using the program DB-master One, for keeping a quite large
database. Now, he's feeling the computer is getting to slow,
and for compatibility reasons, he wants to buy a PC.

Is there someone who knows if there is any conversion possible
from the db-master fileformat to a standard PC database format,
or eventually to ASCII?

When there's no such tool, can somebody explain the db-master
format to me, I can write a tool myself.

Please answer by email, I don't read this group too often.

Thanks in advance,

Rienk.

>numbers. Now, I can see how to convert integers or real numbers to
>this format but I cant't see how calculations performed on these
>numbers would yield the correct result when re-converted.

First it is important to understand that these numbers are just representations of a binary number. The registers in the 56001 are BINARY registers. How you choose to interpret their contents is up to you. Let's take an 8 bit BINARY register. When you first learn about assembly language you normally treat it as an integer, and so each bit has a heading value:

```
128  64  32  16   8   4   2   1
--- --- --- --- --- --- --- ---
 1   0   1   0   1   0   1   0       =     170
```

These headings can be represented as powers of two:

```
     7   6   5   4   3   2   1   0
    2   2   2   2   2   2   2   2
   --- --- --- --- --- --- --- ---
    1   0   1   0   1   0   1   0       =     170
```

For two's complement numbers, the seventh bit represents -128, or -2 to the power of 7. Let's ignore two's complement for the moment, and do an addition:

```
              10101010    =   170
            + 00001000    = +   8
           -----------        ---
              10110010    =   178
```

Now let's do the same thing with fixed point numbers. We'll keep the binary contents of the registers the same, and see how it works out. The headings are:

```
0.5  0.25  0.125  0.0625  0.03125  0.015625  0.0078125  0.00390625
---  ----  -----  ------  -------  --------  ---------  ----------
 1    0      1       0       1         0          1          0

                        =   0.6640625
```

The headings can be rewritten as powers of 2:

```
  -1   -2   -3   -4   -5   -6   -7   -8
 2    2    2    2    2    2    2    2
----------------------------------------
```

Now let's redo the binary adition as before:

```
              10101010    =   0.6640625
            + 00001000    = + 0.0312500
           -----------        ---------
              10110010    =   0.6953125
```

The addition has worked in fixed point format as well. If you look at

the binary contents of the registers of the 56001 before and after a 24 or 48 bit addition or subtraction, you will notice that the operation is just a simple binary operation. It is us as programmers that choose the headings for each binary digit.

Now to contradict what I have just said, let's go on to multiplication and division. If you do a multiply on the 56001, and do the same operation on the 68000 you will NOT get the same answer. The reason is a bit involved and not worth going into here. However, it is easy to convert between the two. The binary value obatined by the 56001 is shifted left by one bit. If we were doing integer sums on a 56001 and we did a multiply, this must be followed by a shift right by one bit to compensate.

Division is nore complicated still. Try experimenting, but look out for overflows (remember the answer to 0.5 divided by 0.25 won't fit in the fixed point registers).

If your having trouble, look at my articles in ST Format. They are a fairly basic introduction to the 56001 and DSP in general. Good luck!

Paul

Hi,

I am writting a CLI and am having a problem in getting the GEMDOS library function FNpexec% to work. The problem is that whenever I try to execute the program, I get an error 131, Sub program FNPEXEC% not found. I have used defint a-z and rem $option k100 at the start and the program works without this line but as soon as I add this call, an error occurs whilst compiling it. Can anyone help me?

Chris.

: Cheers,

: Richard.

I hope I would be informed. I have never received so much as a postcard
indicating I am even on their user list. I mailed it a year ago.

I hope the Falcon version is released. It is the one I am interested in,
as I rarely use my ST (if at all).

Thank you for the info,

Rich

I haven't been following this conversation very closely... But I guess
it's been about converting the Doom for the ST & Falcon.

I think that writing a vector/polygon based Doom for the ST shouldn't be
an impossible task for an experienced programmer. (Though I'm not saying
it would be very simple either. But not impossible, anyway.)

Writing a texture mapped Doom conversion for the Falcon is another
story. But I don't think it would be impossible. If the main engine was
build to run entirely on the DSP and the CPU was only used to transfer GFX
data (DSP would simply deliver GFX data pointers [for each pixel] to the CPU,
which would then transfer the GFX data to the screen...), it could be
possible to achieve a frame rate of about 15-20 frames per sec (320x200). The
CPU code would have to be very optimized (that's not difficult as transferring
one pixel takes only two MOVEs) and a few neat tricks could be used... (For
example, if the most used texture patterns [floor and ceiling] were stored in
the DSP memory, the CPU would only have make to one MOVE per pixel.) ...to boost
up the routine. Sound FX would be handled by the DMA (so no music). WADs (the
maps were called WADs, right?) would have to be put in the DSP memory. (They're
not that big, are they?) The DSP would just have to take care of screenfull of
texture mapped GFX in about 800k _instruction_ cycles (and take care of
everything else, too). So what do ya think about dis?

That sure seemed like a flippant reply, but sure enough, the
description for vsl_width() in Compute!s Technical Reference Guide:
Volume 1, VDI by Sheldon Leemon (where did he go, anyway?) on page
248 clearly states:

"This command sets the width of the lines produced by subsequent
line-drawing operations. On the ST, the line width may be any
odd number from 1 through 39. Requests for even numbers will cause
the next-lowest odd-numbered width to be set. Note that when lines
wider than one pixel are being used, the current line pattern will
be ignored, and a solid line will be drawn."

-- George

I certainly wish someone would find and fund Sheldom Leemon for a
MultiTOS book....

newsgroups: comp.sys.atari.programmer

I want to draw RSC dialogs to an offscreen mono bitmap (EdDI) and then
save as IMG. I have all the other bits of this task solved, but output
from objc_draw() goes to the screen no matter what I do... :-(I use GFA
basic, setting the handle using V~H=offscreenhandle&.

As I understand it, AES uses VDI for objc_draw(). I have used VDI
commands to the offscreen bitmap without problems, so there must be a way
to "trick" objc_draw() to direct its VDI calls to another workstation...?

But HOW?

The alternative will be to write a replacement for objc_draw(), and while
it will not be very difficult, it will be a lot of work... :-(

I'm grateful for any help on this...

Well it is theorically impossible, because the AES opens its own physical and
logical workstation (AES is supposed to work on screen only). So the best way
is to find where the AES's workstation handle is stored and to alter it.

But it's both tricky and risky, because you'll also get the mouse curso, menus
and everything else that's displayed. Good luck, hope it helps a bit

summary: Atari ST Hardware and Software for sale
organization: Telerama Public Access Internet, Pittsburgh, PA
keywords: atari, st, for sale, sale, software, hardware
newsgroups:
comp.sys.atari,comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.st.tech,
misc.forsale.computers,misc.forsale.computers.other.systems,misc.forsale.computers
.other.software,pa.forsale,pgh.forsale,pitt.forsale,us.forsale.computers

Most software has original boxes and documentation.
All software are original disks, not back-ups or copies.

Some of the hardware also has the boxes that they came in,
but some do not, such as the hard drives, disk drives for parts,
1040 case and RF shield, etc.

All prices are in US Dollars and do not include Shipping costs.
All prices are negotiable and open to reasonable offers.
Payment by personal check will be shipped after the check clears
my bank, aprox. 5 working days. Payments by money orders will be
shipped the day after payment is received.
Priority will be given to orders of 5 or more items.
This list current as of: 8/17/95

Item Name starting with (P) is possibly sold, in negotiations,
or awaiting payment.

ATARI HARDWARE FOR SALE:

ASKING PRICE	ITEM NAME
$350.00	1040 ST/F 4megs mem., tos2.06 TEC board, ADspeed 16mhz upgrade.
$175.00	1040 ST/F(M?) 1meg memory MIGHT BE 520
$350.00	1040 STE 4megs mem.
$125.00	Color Monitors Atari brands
$125.00	Color Monitors Atari brands
$25.00	Color Monitors Atari brands (broken, power box)
$90.00	SM124 Mono Monitor
$80.00	(P) Indus GT External 720k Floppy
$25.00	The BEst TrackBall
$35.00	The Cordless Mouse (Practical Solutions)
$300.00	Toadfile 130meg + 80meg HD w/ICD+ host
$160.00	ShoeBox 80meg HD w/ICD+ host
$110.00	20meg shoebox, atari adapter
$20.00	Mouse Master
$15.00	Monitor Master(toad brand?)
$30.00	Video Key
$15.00	ST Video Digitizer
$110.00	The Complete Colour Solution (Vidi-ST, Vidi-RGB and VidiChrome ST)
$100.00	Stereo Replay audio digitizer
$35.00	ST Sound Digitizer (Hippopotamaus)
$8.00	2 assorted internal floppy drives for parts
$10.00	1040 case and rf shield (used)

I am not familiar with db-master, however you should be able to export in
ascii delimited format, which should be acceptable to any dbase program.
good luck.bonne chance

(Assuming you are doing the normal "walking the window rectangle list")
Try these speedups :

1) Work out how deep the screen is. Divide this by the height of one
line of text. Output this number of lines.

2) Work out which line is the topmost line in your clipped rectangle.
Work out how deep the rectangle is in lines of text. If zero, skip to the
next rectangle, otherwise output this number of lines.

It is a good technique to use if the system you are running on is lightly
loaded, or has a conspicuous overabundance of free RAM.

But if you have some text 4009 lines long, and are running on a minimally
equipped system (or something without enough room to swing a RAM chip),
then you will not be able to do this.

> Question 1:

> (number of colour planes) x (horizontal resolution) x (vertical resolution)?

> The ST resolutions are 32K each. But how does this work for True colour mode
> on the Falcon?

If you multiply this out, you'll find that you will come up with numbers
far higher than 32000 bytes. What you have calculated here is the number
of _bits_ to store the screen image. Divide this number by eight.

Following example for ST Medium shows this :

```
planes * horiz * vert
= 2 * 640 * 200
= 2 * 128000
= 256000 BITS!!  divide by 8 = 32000
```

DO NOT hardcode the 32000 bytes as a requirement for a screen into your code! Calculate it on-the-fly from available data.

Use the "number of bitplanes available" data returned by vq_extnd. The number of colours returned in Falcon TrueColour mode is 256, which implies 8-bit colour, which is incorrect.

True colour Falcon screens are 16 bitplanes "deep".

I dont know what language you are using, so, I hope this code written in Lattice C will be useful. If you are at all unsure of this, email me.

(I've ignored obvious error checking in this example, so be sure you know _exactly_ what you are doing before incorporating this into a production program)

```
#include <aes.h>
#include <osbind.h>
#include <vdi.h>

unsigned long ScreenRamSize( unsigned short handle )
{
     unsigned short wo[2][57];
     unsigned long w, h, p;

     vq_extnd( handle, 0, wo[0] );
     vq_extnd( handle, 1, wo[1] );

     w = wo[0][0] + 1;
     h = wo[0][1] + 1;
     p = wo[1][4];

     return (w * h * p) / 8;
}

void main( void )
{
     unsigned short dummy, handle;
     unsigned long ramreq;
     void *screenram;

     appl_init();
     handle = graf_handle( &dummy, &dummy, &dummy, &dummy );
     ramreq = ScreenRamSize( handle );
     screenram = Malloc( ramreq );

     DoSomething();
```

```
        Mfree( screenram );
        appl_exit();
    }
```

AFAIK, the AES opens it's own VDI workstation to do any drawing. The handle

of this workstation is what is returned with graf_handle().

As the the workstation is already open, I doubt that you could redirect it to another handle. The only way that may be possible is by altering the value of the handle, which I _think_ is stored in the negative-offset LineA structures. This seems very dodgy though. I doubt it would be compatable across all TOSes.

On the subject of EdDI and offscreen bitmaps, I'm trying to use NVDI to do this, with v_opnbm() etc. Unfortunately, I only have the German NVDI programmer's guide, and I don't speak German, so it's all a bit hit and miss. I would be grateful if someone could mail or post some sample code that opens an offscreen bitmap and draws on it, as I keep getting memory protection errors from MagiC when I try it.

As for EdDI, am I right in thinking that this is a freeware (?) program that allows you to use NVDI's offscreen bitmap facilities, without NVDI?
If so, where can I get it from, as it doesn't seem to be on the usual FTP sites.

Thanks for any help,

I've analysed the levels in the unregistered version of DOOM and found
that there would be no problem putting all the relevant data from those
in the DSP memory.

>keep part of the maps in the main memory if that's necessary... I don't
>think this is a problem at all.

Well, to make a BSP tree traversal as in DOOM efficient, I think it really
is necessary to have all the map data available at all times. As I said, I
don't think that'll be a problem, though. At least not for Id's levels.

>an impossible task for an experienced programmer. (Though I'm not saying

Of course it would be possible, but it would be _incredibly_ slow. As I said in my previous article, an engine (in C) that does the graphics only, without texture mapping, gives around 2fps on a Falcon when compiled with maximum optimizations. Rewriting it in assembler _might_ get that up to 4fps, but I'd really be surprised (I'd be quite happy, though).
Optimizing the clipping algorithms and perspective mapping, would probably be better, but still I don't think it'll get above 10fps at 320x200.

On an ST, which is at least 2-3 times slower and can't do without the c2p, it would be quite unusable.

On top of that, there's of course the need for monster AI, which you'll soon realize is _quite_ difficult to get some speed on. A monster can after all see you from the other end of the map, through a number of windows...

>Writing a texture mapped Doom conversion for the Falcon is another

If you don't use the CPU for the DSP->RAM transfer, the maximum data rate is 1Mbyte per second IIRC. 320x200x20 > 1 million, which makes the idea fall even there.
Sending only start and end coordinates for horizontal and vertical runs would work better, but then the CPU will have more to do. That is what I believe our engine will do eventually.

The main problem with doing this DOOM clone is, as I see it, that we are locked into a given format.
We can't do the normal 'fade distance into darkness', which is used in most programs of this kind on the Falcon, since DOOM doesn't do that.
Neither can we simplify the visibility rules significantly without making the game very different.
Doing a simple raycasting engine for DOOM is not likely to be at all useful since the non-orthogonal walls, windows and 'infinite' visibility would destroy the efficiency.

If anyone is interested in examining an engine that is likely to be quite close to that DOOM uses, please fetch DVIEW030.LZH from my WWW/FTP site mentioned in the .signature. Full C sources compilable at least under GCC and TurboC/PureC are included as are the original C++ sources.

I'd very much like to know about any improvements done to it.

I require a program to convert Videomaster Falcon .VID files to
a .FL? or SEQ format for use in Apex media. As I understand the foramt,
a VID file is a string of TPI (TruePaint images) linked together that
must be run from ram. I would like to be able to edit those files in a
format Apex can load. I'm not much of a programer, and would pay a
fee for a working program and source code. Please e-mail if interested.

Gem only works with & upto 256 colours by palette. It has been patched by Atari to cover True colour mode but only to get Gem up & running.

The big thing that your missing is that the True colour screen is actually 1 colour plane.

```
On a mono screen: 16 pixels are stored in each word ( 1 bitplane )

 4 colour screen: 16 pixels are stored in 2 words
                where the colour for pixel 1 is stored in
                        bit 31 of word 1 &
                        bit 31 of word 2  - therefore 2 bitplanes

16 colour screen: 16 pixels are stored in 4 words
                where the colour for pixel 1 is stored in
                        bit 31 of word 1 &
                        bit 31 of word 2 &
                        bit 31 of word 3 &
                        bit 31 of word 4  - therefore 4 bitplanes

256 is 8 & so on ( ad infinitum... )

True colour mode is 1 pixel per word - therefore 1 plane ( no bit )
```

Use the call xbios(88,-1) this will return the screen setup for the Falcon. If Xbios(88,-1) AND 7 =4 then allocate 2*Xres*Yres bytes.

```
the answer will be in binary FSOPV8NNN
        where F = 1 = (VGA Double line - halves screen height )
                    or (TV Interlace on - Doubles screen height )
              S = 1 = ST compatable
              O = 1 = Overscan on ( NOT VGA - multiply res by 1.2 )
              P = 1 = Pal / 0 = NTSC
              V = 1 = VGA / 0 = TV/RGB
              8 = 1 = 80 column / 0 = 40 column
            NNN = 100 = Truecolour
                = 011 = 256 Colours
```

```
                        = 010 = 16 Colours
                        = 001 = 4 Colours
                        = 000 = Mono

        Or you could just set up the binary number as above and use
        number of bytes required=XBIOS(91,Binary Screen Res).

        If you are trying to set up the physical screen use
                XBIOS(5,L:0,L:0,3,Binary screen Res) and it will allocate the
memory and re-position the screen.

  When you enter date for the MFDB you must enter it as follows:

        start of MFDB
offset  $0: address of top left corner of screen
offset  $4: X res ( width in pixels )
offset  $6: Y res ( height in pixels )
offset  $8: X res ( number of words in screen width )
offset  $A: 1 ( display type  1 standard , 0 device specific )
offset  $C: 1 ( number of planes )
offset  $E: reserved
offset $10: reserved
offset $12: reserved
offset $14: end of MFDB

        Sorry if I appeared to lecture but this is one of the hardest things to
get your head around and I haven't yet found a book that explained it well. But
once you understand how simple it really is you'll never have trouble with it
again.

Dave

From the sound of things, it seems like "we" are trying to play Doom on an extremely early version of a 386. Doom without the smooth-scrolling graphics and light sourcing is hardly worth playing. Doom without the music and sound effects just isn't Doom. We're trying to do Doom without either of those aspects?? Sounds like a pipe dream.

First, I must say that you there, making DOOM-engine for Ataris, are doing *exactly* the Right Thing ;-) ! Absolutely GREAT, if you'll succeed! So, I hope this encourages you a little =) !!!

I don't think there's any realistic chance to make a ST- or even a TT-version of DOOM. Falcon has its chances because of DSP and its graphical capabilities. I just want to remind you that although Falcon _currently_ is a rather slow 3.84 MIPS (68030) computer, this probably will change in the future. It's already pretty easy and cheap to make the bird run at 32 MHz - and even 68040-Falcons will very probably be reality in 1996. What this means: if DOOM will run sluggishly on an ordinary F-030, it might work very well on a 16..40 MIPS Falcon. Even DSP can be accelerated to about 50 MHz.

What this means? It means that this project is absolutely worth doing, I think =-) !!!

Good luck!

Tommi

There is no problem writing AES programs which use Mint features, or
even the mintlibs. Are you creating a GEM program with your linker?
The startup stubs are usually different for GEM programs and TOS
programs. You may also have problems if your program has a TTP or TOS
filename extension.

Is there any of this freely available? has anyone got any C/C++ code for a
morpher on the Atari that they can share with me? Anything would be great :)
 Not even the full morpher, any parts of teh morphing routines greatly
accepted :)
And can anyone tell me is they have come across a book the details how to
program morphers, lists code, etc.. This would really help me :)
Thanks :)

Andy

I have an application which crash on Mag!x with "MCB destroyed by User Program". This program however works fine on tos 1.04 & 2.06, so it's not the program (or at least I think it's not the program). I traced to the point where the crash occurs, and it is the malloc() call of Pure C. Anyone have any ideas what the problem with Pure C malloc() ?

Regards
William

Hello everybody !

I've got a question concerning my machine.

I've got a MEGA ST2 upgraded to 4mb.

I bought ot as it is second hand.

Now I removed the cover, because it started

quitting some time ago and I thought

of the old ATARI overheating problem.

Since I removed the cover it stopped quitting.

But as I removed the cover I discovered that

a component is missing which apparently had once

been part of the machine and was removed some time.

Since I know nothing of computer architecture

I don't know what this component does and why

it had been removed.

Maybe anybody could tell me?

I checked with a friend of mine who has also an

upgraded MEGA ST2, and in whose machine this

component is still present.

It is located at the front of the machine, it is the

second from left.

It's a seven pin component named 74LS11.

It houses three and-and circuits, as I learned from

an electronics catalogue.

If anybody has any information on that, please

respond directly to my e-mail adress.

Thanx a lot.

fp270@fim.uni-erlangen.de

  I haven't programmed on the Atari for at least 5 years now, but I

figured I'd pass on this info for those of you who still program on the Atari.

When I had an Atari XE/XL system, I wanted to make movie credits on it, but wasn't sure how to fade text in and out. One night, while I was plucking around with it, I found out the setcolor command in BASIC would do just that with 10 levels of fading. Actually it's 5 because there is no difference between the even and odd numbered pallettes are the same.

Unfortunately, I don't remember the exact syntax of the setcolor command. You'll have to look it up. You can actually make some cool looking fades even with only 5 shades.

On the PC, you can fade with the pallette command in BASIC. I thought it only worked in graphics modes, but I think I've seen examples of it in text modes as well. In other languages, such as C and assembly (or assembler if you prefer), you can set the pallette by using direct video card programming.

Did this help anyone? I just figured I'd pass it on to anyone hwo might be interested. If anyone knows of a way to do fading in text modes by changing the pallette, please let me know.

Each time you call Malloc under MAGIX, it'll verify the consistence of the links of the other allocated blocks. If it detects that one of them is damaged, it reports an error.
This means that your program has damaged the links between this and the previous call to Malloc or Mfree. This might happen, if you overwrite the data behind the block that you've allocated. TOS is different here: TOS saves the links between blocks in a different memory area whereas MAGIX

puts this information directly between the allocated blocks. If you
overwrite data behind your block, under TOS you'd not damage the
allocation links but only the block behind it which is only detected
indirectly if you damage important data by this.

Thomas

C> There is no problem writing AES programs which use Mint features, or
C> even the mintlibs. Are you creating a GEM program with your linker?
C> The startup stubs are usually different for GEM programs and TOS
C> programs. You may also have problems if your program has a TTP or TOS
C> filename extension.

I am creating GEM programs, and the file extension is PRG. The
problem is, that I _can_ use AES in the main program, But
with sub-routines, which have been started to run parallel from
the program (with troff) can not access AES.
And one thing more, I'm using MultiTOS.

Regards,
Arto Jalkanen

I upgraded the ROMS on my MEGA 4ST a long time ago (four years) and I had to change from a 6 to 2 ROM chip set, to do so I had to remove a chip from this area of the board. I know this sounds a bit vague, but it might help.

Precisely - that's why we ported it to the Acorn Archimedes, A series
and RiscPC - got it running about 17-20 fps on an uncached ARM2, so
it should be *well* feasable on a Falcon if you use the DSP for
texmapping. Our (aborted) DOOM port would only run on ARM3 or
better (24bit colour on a RiscPC looked *very* sexy <g>) but the
fact that it wasn't financially feasible ($20K licence fee) meant
that it hasn't seen the light of day. But we do know a lot about
how DOOM works and I'm prepared to answer any queries as well as
I can given the strictures of the NDA.

If I read you right, you are splitting the subroutines off to run as
co-routines to the main line program. If this is correct, I think I know
what your problem is. The subroutines are executing in the context of a
different program than registered with the AES. As a result, the AES gets
confused since it is getting requests from someone it never heard of. You'll need
to register the subroutine's process with the AES.

Or, instead of using interrupts, try using the vga registers. First
write the pallete index to port 0x3c8 and then write the red value, blue
value, and green value (in that order) to port 0x3c9. The problem is,
though, is that you need to know the original pallete settings to begin
with. You can't just start fading. In my studies, I've found that
Borland's Turbo Pascal's On-line Help Documentation has some settings
that are pretty close to the vga's default pallete.

Do you have an /etc/resolv.conf file? I think the format is like:

domain domain.level
nameserver xx.xx.xx.xx

where the xx is the *IP* address(es) of your nameservers

You read me quite right (the co-routines although share the main line
programs memory space, so they use the same variables). But
registering the subroutine with the AES doesn't help (with
appl_init call). In fact, appl_init gives the same handle for
the co-routine as for the main program!

I recently posted a request for people to translate the OASIS manual into variuos languages.

The response has been very good, I have so far had offers of translation into the following languages:-

German
Finnish
Swedish
Dutch
Spanish

I would still iike to add French and Itallian to the list. If anyone is interested please feel free to get in touch.

Please be warned, I cannot make anyone rich for performing this task, but as we intend to write a NOS replacement and a Web Browser which would be shareware, free versions of these programs would of course be sent to the translators.

Come on people, do your bit to keep the Atari scene alive, the more people who have access to Atari software the longer we all get to use these damn fine computers.

Thank you in advance to anyone who feels up to the task.

Hi,

is there somebody able to gimme some advice? I tried to copy a big file
from one harddisk-partition to another. My problem is now to get this
copy in short time. Because GFA-BASIC v3.6 TT (D) don't support copying
files between different partitions I made it as follows:

```
OPEN "I",#1,old$
OPEN "O",#2,new$
DO
  EXIT IF EOF(#1)
  a|=INP(#1)  ! read File
  OUT #2,a|   ! write File
LOOP
CLOSE
(KILL old$)   for making a MOVE
```

But this algorithm is very slow. Do you have a faster idea?

TiA

: Hi,

: is there somebody able to gimme some advice? I tried to copy a big file
: from one harddisk-partition to another. My problem is now to get this
: copy in short time. Because GFA-BASIC v3.6 TT (D) don't support copying
: files between different partitions I made it as follows:

```
: OPEN "I",#1,old$
: OPEN "O",#2,new$
: DO
:   EXIT IF EOF(#1)
:   a|=INP(#1)  ! read File
:   OUT #2,a|   ! write File
: LOOP
: CLOSE
: (KILL old$)   for making a MOVE
```

: But this algorithm is very slow. Do you have a faster idea?

Yes, create a memory buffer to contain the data for faster burst transfers.

For example:

```
buffer$=space$(32000)
'
OPEN "I",#1,old$
OPEN "O",#2,new$
'
length%=lof(#1)
'
WHILE length%
  IF length%>32000
    buffer$=INPUT$(32000,#1)
    SUB length%,32000
  ELSE
    buffer$=INPUT$(length%,#1)
    CLR length%
  ENDIF
  PRINT #2,buffer$;
WEND
'
CLR buffer$
CLOSE
```

I hope this helps. All disk operations work a lot faster if you read and
write a lot of data in one shot.

That was the simplest way of doing a data transfer. You can increase the buffer size by using arrays or even allocating memory directly via MALLOC(). However, this routine is quite sufficient.

```

Why not use BGET and BPUT,

```
INLINE buffer%,1000
OPEN "I",#1,old$
OPEN "O",#2,new$
length%=LOF(#1)
WHILE length%
  IF length%>1000
    BGET #1,buffer%,1000
    BPOT #2,buffer%,1000
    SUB length%,1000
  ELSE
    BGET #1,buffer%,length%
    BPUT #1,buffer%,length%
  ENDIF
WEND
CLOSE #1
CLOSE #2
```

This gets away from the allocation of string space and gives one fixed area for all file transfer actions to carried out through.

Of course, all these different methods work, it boils down to personal preference.
Heck, if it works for you, leave it alone!

I haven't used GFA for a long time, so I hope these small algorithmic changes will work satisfactorily with it. (It does when written in C).

Changes :

1) Buffer needs to be a multiple of the disc sector/cluster size. This speeds the process due to the HDD needing to seek to the appropriate place only once at the beginning of the BGET/BPUT, rather than part way through. This change will speed things up by a fair margin on a semi-fragmented drive.

2) Checking the size remaining is done once per iteration as part of the "WHILE" construct, not twice ("WHILE" and "IF"). Doing so allows the body of the loop to be totally dedicated to the disc copy, rather than checking how much is left. This will speed up the copy slightly, assuming a good compiler.

3) Any bits of the file left over from the loop are copied just after the loop terminates. (This was part of the #2 change).

4) As a matter of personal preference, I'd close my files in reverse order to how they were opened. The language you are using, or the OS for that matter, may use ome allocated buffer to store details about the opened file. Closing the files in reverse order allows it to release this buffer space back for other usage.

```
INLINE buffer%,1024
OPEN "I",#1,old$
OPEN "O",#2,new$
```

```
length%=LOF(#1)
WHILE length%>1024
  BGET #1,buffer%,1024
  BPUT #2,buffer%,1024
  SUB length%,1024
WEND
BGET #1,buffer%,length%
BPUT #2,buffer%,length%
CLOSE #2
CLOSE #1
```

Yes, that method works just as well. You could use BGET and BPUT in conjunction with an array, BGET and BPUT in conjuntion with RESERVE and MALLOC(), BGET and BPUT in conjunction with a preallocated string. However, it tends to make the code shorter (and just as fast) if a string is used with INPUT$(). Besides, as a note, your routine is slower due to the smaller buffer size. Using INLINE wastes memory if that memory is not used all of the time. A string allows for fast dynamic memory allocation, and the memory can be reused later for something else. To speed up your routine just increase the INLINE size, but once again it's a waste of memory.

Personally, I first determine the size of the file and how much memory is available to my program before a certain algorithm is used. Mostly the BGET and BPUT in conjunction to MALLOC() is what I use.

However, it really doesn't matter. They all work.

GFA Basic buffers file access internally, so the multiple of disc medium is unnecessary (apart from some disc compression methods changing these figures).

As you say, personal prefernce. AFAIK the GEM handle system for files gets arounbd this possible problem, but the reverse order method is a good

working method.

I have never tried C, I have always been put off by the Data Structures and the seemingly very fussy syntax!

Personally over the last eight years I have found GFA to be a very flexible and powerful language, does anybody know what happened to version 4?

You don't know what you are missing out on. I used to be a great fan of Hisoft's Power Basic for much the same reason. However once I was forced to learn C, there was no turning back. Totally flexible - and the syntax is cryptic rather than fussy. The main advantage is that you are not then restricted to programming for a limted user base. There are C compilers available for virtually all computer platforms in existance. Also there is a vast amount of free C source code on the 'net which can easily be recompiled onto most platforms including Ataris.

One last point to note is that you can kit yourself out with a C compiler for free. If you are short on memory then Sozobon C is a good place to start. Other than that GNU C (GCC) is the best bet. This not only looks and feels like a real minicomputer C development system. It *is* one! :-) Very powerful, and realy not that hard to use IMHO. Can be a bit of a pig to set up though.

:-)

Roland.

As mentions under the subject-item, I am looking for something that
can make my Canon lbp-4 printer handle TeX-things.

Im running the CTex-shell (dont know the version, but its fairly new)
and Im using MusicTex sometimes.

By now I have to bring my .dvi-files at work to use dvips, but there
must be some way to bring the lbp-4 alive.

If not directly from tex, then by some conversion-of-graphic-means

Please e-mail if possible.

Thanks,

lafrance@musik.auc.dk

R> : But this algorithm is very slow. Do you have a faster idea?

And I was astonished, how many of you were so kind to give me some advice
here in this area or as personal mail :-))! Many, many thanks! The German
release of the manual to GFA-BASIC 3.6 TT contains not so many cross
references, so it would take a long time to me finding out this methods.

I decided to use the algorythm with the string-solution, after I'd tested
all suggested possibilities in point of speed and memory-allocation. The
method with BGET and BPUT was in all variations slower (and shorter) than
the INPUT$()-method. But - I still don't know why - the string method

does not completly free the allocated memory. I use it know in the
following way:

```
PROCEDURE test(lof%,ink|,outk|)
  buffer%=4096
  IF lof%>buffer%                    ! This IF makes the algo a bit
    buffer%=MIN(MALLOC(TRUE),32000)  ! faster, if the MIN and MALLOC
  ENDIF                              ! function is not to be called
  '                                  ! for every little file < 4 KB
  buffer$=SPACE$(buffer%)
  '
  WHILE lof%>buffer%
    buffer$=INPUT$(buffer%,#ink|)
    PRINT #outk|;buffer$;
    SUB lof%,buffer%
  WEND
  '
  buffer$=INPUT$(lof%,#ink|)
  PRINT #outk|;buffer$
RETURN
```

BTW: Reverse closing of opened files I would prefer too. GFA-BASIC
supports additionally to CLOSE #channel, which closes specific the
determined channel, the command CLOSE without parameters closing
all openend files. Does anyone know, wether this operates in reverse
direction or not?

Marko

Ha! You think the native German version of the GFA manual is bad... you ought to check out the English version! Looks like it was done by an elementary school student. I had always thought the typos and errors were due to poor translation but maybe the original was poorly written as well? Sadly, the MS-DOS and Windows GFA manuals are no better.

: Their would end up to many patched and adapted versions, and were would be
: then, its like this Magic TOS, how compatible is it, from post I have seen
: here its not that compatible...

This is rubbish. As an actual user of MagiC (2.01 on a 4meg Atari 520STFM),
I can state that MagiC is very compatible. Users generally experience
problems with old software such as Calamus 1.09, Cubase and old PD software.
This is almost always down to programmers breaking GEM guidelines (although
I would agree that these have been difficult to obtain in the past, and
there may have been good reasons at the time). Users who experience problems
should look at upgrading their software, rather than automatically moaning
about MagiC. We have Calamus S and SL, Layout, Notator Logic, excellent
shareware products such as Everest, Edith, Twoinone, Kandinsky, Thing,
Egale, Gemini... ALL are compatible with MagiC.

IMHO all Atari users should check out MagiC 3 when it finally appears. The
competition looks quite sad in comparison.

Cheers,

Richard.

newsgroups: comp.sys.atari.programmer
summary: Computing screen data size, double click problem

Hi. I'm writing a small GEM program and have a few questions. Basically, my program stores some text in a standard GEM window. The user can click on the horizontal arrows to scroll the text up and down a line at a time and can drag the vertical slider around to view sections of the text.

I would like to speed up the redraw routines. Presently, my code simply sets the clipping rectangle and redraws the dirty rectangle by printing in the entire window's work area with v_gtext(). This works okay on my Falcon, but the redraw is extremely noticeable on the ST.

I've been playing around with GEM's memory form definition blocks (MFDB) to copy blit chunks of the screen around. I did this to speed up my vertical line scrolling. I'm thinking of saving a copy of the screen in an MFDB so that screen redraws are simply a matter of blitting back my copy of the screen.

Question 1:
If I understand correctly, I need to allocate memory and save the pointer in the fd_addr field of the MFDB. How much memory do I need to allocate? Is it the

(number of colour planes) x (horizontal resolution) x (vertical resolution)?

The ST resolutions are 32K each. But how does this work for True colour mode on the Falcon?

Question 2:
I'm running into the "double-click" problem where if you click in the vertical scroll bar, you get two {WA_DNARROW,WA_UPARROW,WA_DNPAGE,WA_UPPAGE} events. This occurs on the Falcon but not on the ST. I know there was an AUTO folder program that patched this problem, but I'm looking for a software solution. How does the Atari Desktop do it?

Thanks in advance.

William Wong (wongck@ti.com) wrote:

: I have an application which crash on Mag!x with "MCB destroyed by User
: Program". This program however works fine on tos 1.04 & 2.06, so it's not the
: program (or at least I think it's not the program). I traced to the point
: where the crash occurs, and it is the malloc() call of Pure C. Anyone have any
: ideas what the problem with Pure C malloc() ?

William, it is the program. It would seem that the Pure C binding of Malloc() does its own memory allocation instead of using the GEMDOS one. Mag!X uses a different approach to memory allocation and gets ticked off if its memory structures and links are tampered with or destroyed without its permission. Calling Malloc() directly via some other means should solve your problems IF that's what's causing the problem. Typically it's a program accessing memory that doesn't belong to it, that causes problems in any multitasking environment.

Typically TOS 1.04 and 2.06 don't care is your program is the only one running after the desktop has been executed. TOS also keeps all of its memory pointers and structures in protected memory (supervisor) and thus are difficult to destroy. Mag!X puts the structures right in each region of memory allocated and links them all together. This has many advantages.

1> Unlimited amounts of Malloc() calls can be executed (theoretically).
2> Speed of allocation
3> Makes memory boundary checking easier for processors without memory protection capabilities (68000).

Downfalls:

1> System collapses when an unbehaved program (or a program compiled
with an unbehaved run-time library) accesses illegal memory.
2> Compatibility with these programs is nonexistent.

Good luck, sometimes it's a problem a previous action has caused that
makes it seem Malloc() is the cause. I have had the problem myself a
couple of times. Malloc() just makes it show up, and yet it wasn't the
problem.

I am currently writing a program in Basic

How can I read the parameter-list/string which is
pass on to *.ttp program at program start ?

This is probably a simple problem, but I cant find
the information in the HI-SOFT Basic / GFA-Basic documentation.

help is appreciated

Version 4 was released for the PoliticallyCorrect (ptui!) machines in
mid-to-late 1991.

Shortly thereafter GFA for Windows was released, which was "fully source
compatible" [sic] with v4.

Since then Visual Basic has overshadowed it on the Intel platform.

I dont recall seeing it available for sale in the last few months.

The Atari GFA-Basic stalled at v3.7. Supposedly there was only about 150
hours or so of work left, and a call for help completing it was issued.

I dont recall seeing anything after that.

The first thing you need to gain access to is the BASEPAGE, then you add 128 bytes to this to get the start of the command tail.

In Hisoft this is got with PBASEADDR.
In GFA this is a system variable BASEPAGE.

The only other thing to note is that BASEPAGE+128 contains 1 byte of the length of the command tail string. The string starts at BASEPAGE+129 and it ends with a character 0.

In GFA basic it can be got with

```
command$=CHAR{BASEPAGE+129}
```

I'm sorry I can't do it in Hisoft as I haven't got it.

Hope this helps - Dave.

I think a doom-clone would be a great idea. From what I've seen so far on the falcon scene - the speed could be a problem, but not one that can't be resolved with some careful '030 / DSP coding. I'm still a novice at assembly language coding - but if a bunch of coders decided to get together over the 'net and give it a try, I'd be in it. So how about it guys, stop debating over whether it is feasible and give it a try?

BTW: anyone know what's happening with the 'doomino' engine - the 96ktro comp entry by STAX at fried bits this year? It looked quite promising, despite the bugs.

Yiannis.

Well, I figured out my problem. The trick is to set the PPP options so that the PPP daemon will set the local IP address as well as the IP address of the end point of the link. Failure to to that will cause the link to be one-way.

Now, can someone tell me:
1) Where can I get TIN, the newsreader for the ST
2) Are there any replacement serial port devices for the TT that support direct setting of the serial port to baud rates above 19.2K?
3) Is the TAF distribution of the Chimera brouser set up with the correct URL's? I cannot seem to get it to go online, even though I can now FTP.
4) Has anyone done an X server that simply translates the X commands into GEM AES/VDI calls? This would allow X applications to co-exist with GEM, allow X to benefit from enhanced res boards, speedups from NVDI, etc. Having to choose between X or GEM sucks!

5) Does anyone know how to mount a file system under the NFS system? I have
seen that certain sites allow AFS access to their files, and I assume
(possably incorrectly) that NFS and AFS are related.

I don't know how easily it will compile on the Atari but tin can be found at
ftp.demon.co.uk:/pub/unix/news/tin IIRC. Perhaps there is a hacked source
around that will compile easily for the Atari..

> 5) Does anyone know how to mount a file system under the NFS system? I have

You have an /etc/exports for directories that are exported on your system, I
can't remember the syntax, 'man exports' perhaps. :-)

When you want to mount you do for example:

mount nfs_server:/exported_dir /mount_point

Make sure you have created a directory on your system to mount onto, eg.
/mount_point in this case.

As I said, you should be able to work this out by looking at the man pages,
ie. 'man mount'.

> seen that certain sites allow AFS access to their files, and I assume
> (possably incorrectly) that NFS and AFS are related.

AFS is Andrew File System, an enhanced version of NFS (Network File System) developed at Carnegie Melon (sp?) University. I think most of the enhancements were centered around security.

And yes, you can NFS mount src.doc.ic.ac.uk

There's a need for law and order. It actually preserves rights and freedoms and prevents anarchy. Laws, in a free society, are made by society. When differing opinions are expressed the society remains aware, alert, and healthy. When others decide to live in a society, but live by their own rules they have no right to live in that society as it violates the very fabric holding that society together, law.

Obeying laws by convenience is not good for society. If you do not like the nature of a law, then you use LEGAL means to get that law changed or removed.

So, from what you tell me. If you write a great book and have it published and you acquire a loyal following. You then decide to publish a sequel, but while writing it you decide not to publish it now. You are almost finished with it and have given preliminary copies to friends to read.

Let's now say you may or may not want to publish it in the future.

Ok, one of your friends accidently (or intentionally) leaves the preliminary copy out for someone to get. Ok, now your "loyal" fans want to publish it themselves because you weren't "loyal" to them by publishing it yourself. They'd rather just go down to their local copy shops and have a few dozen run off and given to their fan friends, and so on.

Are you telling me that what they are doing is legal, right, and fair to you?

It's reaching, but who's to say Atari is not going to do something in the future with TOS? Users do NOT have to be supported by the computer manufacturer after the sale is made. That is a risk the user takes. Warranty on operation is all you have rights to. Support is for developers and users. Support does not include theft of property and technology just because you "deserve" it.

Nobody DESERVES anything. You earn and pay for what you get. Sure, users are stung and hurt by Atari's actions, but that does not justify breaking the law. No matter how insignificant the users think the law is. If you really do not like it, then get the law changed.

You mentioned Hitler. Yes, he was a horrible person, but if you study history more throughly, then you will notice he changed things in Germany quite LEGALLY. Parliment relinquished their powers to him after he was elected Chancellor and the President died.

Next you will tell me about the American Revolution. However, all legal means were exhausted before war was declared in that situation.

Laws were made for obedience and not to be broken. Change the law if you don't like it. Also, you might want to read the USA Declaration of Independance, USA Constitution, and the Magna Carta. You will find they were written by lovers of freedom and law. You will also find that freedom cannot come without law.

The previous was only meant to convey the opinions and beliefs of Richard Kelsch (an Atari user, USA citizen, Republican, religous person, and respector of all views and opinions) in a more specific and understandable manner. So as to portray a better understanding. It was not meant as a flame or to infringe upon the receiver's rights to his opinions and way of life.

Rich

>TOS ROMs pay for the priviledge.

AFAIK Atari have not licensed anything above TOS 4.04 (note I could well be talking crap here :)) ie the tos 4.92 that they are/were in the process of developing is just sitting around doing nothing.

>Just because Atari no longer manufactures home computers and no longer
>develops TOS does not mean they do not earn money on TOS.

True, but I believe Atari have publicly announced they are no longer supporting or developing their computer side of things, hadrware or software in order to concentrate on the Jaguar.

If this is the case, Tos 4.92 and AES 4.1 will just sit somewhere doing nothing. Neither has been officially released or sold. Neither is or will make any money for Atari or anyone else.
If you have something that is nearly finished but you have no intention of developing it more, or selling it as it is, why not give it away free?

Whatever happens it is still illegal to give away copies of these (and possess a copy) until Atari says otherwise.

I personally would be happy to get hold of a copy of the new TOS but that is just my opinion. As well as everything else I have just said, most of which could be entirely wrong. I'm just going by what I've been told.

Phil

All my problems I have either under TOS and MiNT.

> If you have an '030 machine and are not developing for GEM, I'd strongly
> suggest setting up Linux (I have no probs debugging c++ progs compiled
> under GCC 2.6.3).

Very funny...

Of course I need the gcc 2.6.3 to use with GEM, otherwise I have linux
instaled and have no problems with debuggnig C/C++ programs under it (Is
there anone, who has???). As I see there is no many gus programming in
very useful C++ and/or **GREAT** GEM++ library. That's pity.

For a moment I fix my problem something like 'manually' but it works.
Exactly the problem is that in gcc 2.6.x there is new builtin type bool
and the mentioned problems with gdb are caused by new non-standard
symbols generated in this occasion by gcc or maybe sym-linker. If there
is ANYONE (I doubt...) intrested, I can send him my own little utility
witch fix the sym file, so I CAN AGAIN DEBUG MY C++(gcc2.6.3 syntax)
PROGRAMS WITH gdb 3.6pl4 UNDER MiNT!!!!!!

Anyway if there is ANYONE developing for GEM with gcc 2.6.3 please

*** A N S W E R ***

This not a valid analogy. We are talking not about a sequel but a corrected
and updated revision.

A more apt analogy would be if the ANSI committee had refused to publish the
C spec and insisted on everyone making do with the draft.

>Nobody DESERVES anything. You earn and pay for what you get. Sure,

We DESERVE Respect. At the very least they should release any such improved software they might have mouldering on the shelf or give a clear explanation of why the they choose not to.

There is also the not so small matter of the 'goodwill' releasing 4.92/4.1 would generate for Atari. Some of which might even spill over into the Jaguar arena, there supposed focus of operation.

-
Two completely separate issues. Yes, drives have become real cheap. Three
years ago, I paid US$350 for a $100MB drive. Last year I replaced it with a
500MB model for about the same price. Now, the same size drive is under $250.
That's pretty darn cheap in computer terms.
-
Microsloth does produce dreadful, bloated stuff that consumes far too much disk
space, RAM, and CPU time, but that's another story.
-
M> So, now you're using the same excuse. Are you a lazy programmer that

-
I think that's a rediculous attitude. HDs have major, major advantages. Yes,
you can continue to limp along with a floppy-only system, but why would you
want to? Once I experience HD use on my ST I found using floppies to be a
major drag.

Hi all fellow atarians!

I have had a Falcon for some time now. A while back I did buy lattic C from hiSoft, from a friend, only to find that it was the release just before any real Falcon support was added. :-(

What I want to make/program is stuff that deals with sound, realtime fxs, sample playing also in conjunction with midi.

I would prefer not to have to program the dsp in assembler.

So what I am looking for I guess is a super compiler, with lots of lib that are enhanced or made for the Falcon, that would enable control over the stuff I outlined above.

If anyone else has done development like this, or at least similar, I would be most interested in what tools you use, what kinda libs are included and so on.

Also I would be very happy if gcc could do this? That is has anybody made any libs for gcc that deals with this stuff? What would be really cool would be a port of voxware for Intel/Linux to Falcon/linux or mint, with libs that would utilise the dsp :-)

I also need to know I would go about routing sound around inside the falcon, how to control the ad/dac etc ad infinitum.. :-)

As always all help is very welcome!

Is your EVENT_MULTI call waiting for events on both mouse buttons, if so (if I remember correctly) then double clicks don't get detected, I

don't think this was fixed in any versions of TOS, but I may well be wrong here (I've not seen the complete bug fixes/new bugs lists for the newer TOSes).

Before I talk about what really interests me, let me personnaly answer Timothy Miller.
In article <3u7ha1$6lu@mother.usf.edu>,
   millert@grad.csee.usf.edu (Timothy Miller) wrote:
>So, now you're using the same excuse. Are you a lazy programmer that
>wastes time and space at every turn just because you don't feel like
>taking an extra minute to make your software GOOD? If you're that lazy,

>then program for Ataris.
Just the kind of aggressive messages the newsgroups could do without. I've learned programming on 8 bit machines a long time ago. In these days, you had to crunch your code into the very limited 13Ko of a TI99 or the 38 free Ko of an atari 800. You also had to cope with the dreadfully slow processors of these machines. I have released quite a few succesful games on these machines. From this I've learned how to keep a code fast and compact and have never lost these good habits. I have no lesson to take from you or whoever about compact and fast codeing.
End of the flame.

Now for something completely different:
It seems people begin to find my idea interesting. Perhaps it's not time any more, as you have suggested, to discuss IF it can be done, but HOW? And WHO is going to do it. Personally, I don't have much time but am ready to contribute what I can.
Perhaps anybody interested and motivated could say so.
And perhaps this could be a great collaboration between atari people on the net.

I think there are several problems to be solved:
* the 3D engine that will draw the walls
* the scaled sprites for the monsters
* the interaction of walls and sprites
* the game itself: moving the monsters, weapons and their projectiles, etc.
* the interpretation of WAD files, and perhaps the translating program to get rid of the textures (if we get rid of them)
* the communication via modem, null modem, midi or LAN with DOOM on atari or other platforms.

Anyone wanting to solve one or several of these problems could post here and say so.
Finally, we would need a person to supervise the whole project and set up some norms so that people can understand and interface together the different parts of the program. I would volunteer if I didn't have to go to the army next month. Still, I want to get involved one way or another and will do my best to contribute.
Do you think it's a good idea to do it as a team, like this, or that one person should code the whole thing?
I think we have enough very GOOD programmers on the atari scene (esp. DEMO coders who could find here a good reason to do something else) to get this project done.
And if you know people who would do such a thing but don't have access to the net, or don't read the news, tell them about it.
If there are editors around here, why not talk about the idea in your magazines or fanzines?

Bye.
Bertrand

I can only once again advertise the tremendous GEM++ Object oriented
library for programing GEM applications under gnu C++ by Warwick Alisson.
It is available in almost all atari sites over the world.

It's really worth while!!!

regards,

Simon.

: ^^
: But isn't it also a Federal crime for you to possess it in the first
: place, whether you distribute it or not?

It depends on a lot of things. Do I intend to sell it or distribute
it?...No. Is it a Federal crime for you to record TV programs and movies
off of HBO?...No. Is it a crime to sell that copy?...Yes. Is it a crime
to possess TOS 4.92 acquired from Czechoslovakia? No, it is not under
treaty for Copyrights, also it would have to be proved I acquired it
purposes of sale and/or redistribution.

However, conspiring to make a copy, distribute it, and for another to
receive it IS a Federal crime.

: OK, it is still copyrighted etc AFAIK, but seeing as it will never be
: released, or making money in any other way for Atari, I'm sure they won't
: mind people distributing it, thereby keeping some kind of interest in
: their machines.

Instead of assuming Atari will not mind. Why not just ask them? All
assumptions and guesses would be resolved. Afraid you may be wrong??

Phillip Davey (Path) (pd@mole.bio.cam.ac.uk) wrote:

: Whatever happens it is still illegal to give away copies of these (and
: possess a copy) until Atari says otherwise.

Phil, due to a loophole in USA Copyright law and a lack of any text in
international treaty, it is not illegal to possess a copy if it was not
acquired for purposes of malice and illegal intent or acquired via
conspiracy to acquire. If it is just "found", then the loophole stands.

Anyway, it eats up too much of my measly 4 megs.

: of why the they choose not to.

Excuse me, but you PAID for a Falcon WITH TOS INSTALLED in it working and
operational. That is what you DESERVED for the money you paid. Any
future versions are not deserved, they are offered for a price. Atari
earned the money. Any future products whether TOS or not are under
perfect legal right for Atari to offer them for sale or to give them
away. They are not required to be given away out of some customer's
delusional idea that they deserved it out of "respect".

Lots of people now days constantly confuse "respect" for handouts.
Frankly any type of marketing action is the choice of a company.
Granted, I personally believe completely cutting off the computer line
was a very poor move by Atari and will adversely affect them in the
future when it comes to customer SERVICE.

: There is also the not so small matter of the 'goodwill' releasing 4.92/4.1
: would generate for Atari. Some of which might even spill over into the Jaguar
: arena, there supposed focus of operation.

That, of course would be a good move by Atari. However, it is not
something you "deserve". It would be a purely customer SERVICE move.

You can't expect to be given TOS 4.92 or whatever any more than you can
expect that because you bought a 1993 Honda Accord with 4 cylinder engine
that you DESERVE to be given a V6 if Honda chose to discontinue the
Accord's (the V6 is the latest improvement to the Accord line) in 1996.

NO DIFFERENCE!

Rich

Again you have made a poor choice of analogy. A better analogy would be
the ability to acquire a reworked engine management chip, one that is known
to have been developed and sampled but not put into full commercial
production and all enquiries about it being ignored.

I don't believe anyone was 'insisting' they give it away but merely being
constructive in suggesting an alternative course of action if Atari
didn't want the fuss and bother of selling it. Another alternative would
be to issue it as LicenceWare through a library or one of their existing
resellers such as Compo or C-Labs. Just people trying to be helpful.

I mangaged to get things running better:
  1) DO NOT USE A HARDCODED IP ADDRESS! Tell PPPD to set both the local
     and remote IP addresses from what the remote host tells it.
  2) Tell PPPD to add a default route when it makes the link.

I can now do FTP/PING, now if I can just figure out why Chimera doesn't find a any URL's....

Commercial releases of TOS do include its packaging within computers,
separate sales of ROMs, and licensing of TOS to third party "compatibles"
makers. All of these things Atari has done and some Atari still
continues to do.

As to your claim that Atari has "never made an effort in this sense"
appears to be quite delusional.

I'm using Enhanced GEM libraries (2.20) for GNU C 2.5.8 and wondered if any
body knows how to fix the problem, when I do not install SpeedoGDOS at bootup
any of my Enhanced GEM programs (including the test ones sources are compiled
under GNU C) they crash...

Is anybody else having the same problems?

>as we all know) and put on an ftp site somewhere. Anybody who downloads
>this is then handling stolen goods.
>Unless of course I'm totally wrong. :)

The definition of theft as far as English law is concered is "To permanently
deprive the rightful owner of the use and enjoyment of their property"

ie car theft has the charge of "Taking a vehicle without the owners consent"
and not "theft of a vehicle" due to the "permanently deprive" definition
which is hard to prove in this case.
This is a criminal act and the responsibility of the police to detect and
prosecute.

Therefore you will not be charged under English law for the *THEFT* of
TOS 4.92. Theft would not be proved as you have a copy of the property

not the original.

The only likely charge will be brought under the copyright acts. When you purchased your computer atari gave you the right to use (but not copy) the software contained inside. Atari has licensed third parties to provide updated versions of the software (TOS 2.6 is a good example as atari never sold any STE's with this version of the software installed). When you purchased this TOS upgrade atari gave you the right to *USE* this software.

As you have not purchased this version of TOS atari has not given you the right to use the software. This is a civil act and the copyright owner must take action to enforce his rights under the act.

>>Instead of assuming Atari will not mind. Why not just ask them? All
>>assumptions and guesses would be resolved. Afraid you may be wrong??

I assume that if the offer of money is large enough atari would license a third party to distribute this version of TOS. Any takers on this one.8-)

Fair enough, I don't want to put those wonderful people who wrote Substation down at all, as you say for a first effort it's groovy, but why oh why won't we get a Falcon DSP version... cos then you could have textures, walls not at right angles, and so on and so forth.. still, as you so rightly point out, all praise to the Substation people, and I'm sorry if I came across a bit harshly....

Thanks to them for still supporting the Atari TOS machines,

Neil

I had a problem with this, since I don't use ICD on my (borrowed) TT. So I
simply wrote a little program that called setscreen. Just a
setscreen(2,-1,-1) does the trick. That call doesn't work under GEM, but GEM
is not yet active at that point anyway. If anybody needs it, I can mail it
out - it is really small.

Are you opening a physical workstation (v_opnwk) instead of a virtual one (v_opnvwk)?

AFAIR, with any GDOS a physical workstation can be opened, but virtual wkstns are almost always used for the screen and physical wkstns are used only when necessary (e.g. printing via GDOS).

You will notice that my explanation to the fact that it was acquired from Czechoslovakia was incomplete, and for that I apologize. My intention was to explain that because of the nature of how TOS was acquired and by the fact it was not acquired for illegal intent (ie: sale and redistribution, and conspiracy to acquire) that prosecution was not possible. USA copyright laws are not quite up to date as relating to computer data. However, in a case where the FBI would come into play these factors would have to be satisfied to be able to charge one with criminal copyright infringement. As to Atari and their civil prosecution capability, they would have to prove that malice, conspiracy to defraud, and loss of income occured due to the acquisition of TOS. None of the criteria were satisfied.

Also, international treaty on copyrights are even more vague on the matter.

As to redepositing in the FTP sight at Czechoslovakia, 1> the sight no longer exists, 2> That would be illegal intent and would subject one to violations of TWO USA laws. Both Criminal Copyright infringement and

commission of a crime via interstate and international phone lines laws
would be violated.

: the right to use the software. This is a civil act and the copyright
: owner must take action to enforce his rights under the act.

Well said, I you may notice that in previous messages I have been trying
to tell others that very fact. It is also why I will not distribute TOS
4.92 at all. On the other hand, to make acquiring TOS 4.92 even a bit
illegal Atari has to admit it exists. Otherwise any future prosecution
would be null and void up to the point Atari would admit it existed.

: >>Instead of assuming Atari will not mind. Why not just ask them? All
: >>assumptions and guesses would be resolved. Afraid you may be wrong??

: I assume that if the offer of money is large enough atari would license
: a third party to distribute this version of TOS. Any takers on this one.8-)

Not necessarily. A massive customer service boost is good, and so is the

prospect of licensing on a royalty basis. An entrprenurial sort could get some programming types together to finish what Atari started and market it for themselves and pay Atari a percentage based on its sales. That way no up front money would hve to be given.

: >It's actually quite difficult getting an answer from them. Normally you
: >can only speak to "customer service" people who general know little or
: >nothing. AFAIK up until a few months ago Atari denied all knowledge of
: >TOS 4.92 even existing!

Sure, it pays to know who to talk to. I have been able to get to the loyal computer user employees. Sure, it takes time, but it can be done. They can be a great contact and a means of openning a backdoor to send a proposal to.

I hope this has answered a few concerns for you Dennis.

In the whole of this discussion the central question seems to be whether we, when we use AES 4.1 (or TOS 4.92), found on some obscure ftp-site or mailed by someone, actually deprive Atari of income since they licensed TOS to, for example, the Eagle.

In my (humble) opinion, it would be best for Atari to put every single new TOS release immediately on every single ftp site they know of. After all, it might save Atarians from moving to PC. As they're not planning to do anything in computers again, they must concentrate on the user base that's still left. I can't imagine anyone who has taken the step to PC/Mac, to come back to Atari. Even if they came out with a Falcon040.

I, for one, was very happy with the copy of TOS 4.92 I have. I was heavily disappointed in the speed of MultiTOS (although it is still much faster in appearance than, for instance, OS/2 on a 486/40), and the improved TOS 4.92 gave me hope for the future, although the hassle with booting from floppy and the huge memory loss prevents me from

regularly using it. But at least I know it _can_ be done.

I would be _very_ interested in AES 4.1, if that's even faster. I still haven't solved my problems with MiNT only (BlowUP problems) or I'd be using that.

I will state here that, whenever Atari or Eagle or whoever, comes out with a TOS upgrade to 4.92 or a commercial AES 4.1, I will _buy_ it. Even when I already have it. After all, I want to support the platform. But I want to be supported _by_ it as well.

As long as there is no MiNA and no commercial AES 4.1, I would _very_ much like to use a `slightly less legal' AES 4.1.

And about the book parallel: Since the copy of TOS 4.92 _is_ out there, I very much suspect that the original programming team has to do with that. So imagine you've written a beautiful sequel to your book, and your publisher says to you: `Well sorry, we're into comic books now. You can flush it.' I think _I_ would pass out copies to my friends!

Regards,

Companies in Germany are selling 68882s for as little as 45 DM. Check out your local currency rates. The bother is minimal. Open your Falcon, pop in the copro, and close it again. Simple.

One of these day's I'll do it myself. :-)

>oh come on! geeesh, utter nonsense. PC programmers are not lazy or
>stupid, they just use the hardware all (minus 0.01%) users have at home.

And _why_ does everybody have this brand new hardware at home?
Because they _have_ to. I know several people who have had to upgrade
their hardware because the new versions of the software they used no
longer supported the old hardware, or were simply unbearable on it.
I've seen OS/2 in action on a 468/40 w/ 4M RAM. This was considered
quite a powerful machine, one year ago. To say the least, OS/2 was

quite sluggish on it, and I wouldn't run it on my computer if I had a 486/40..

Let me illustrate with an example of PC user attitude (fictive, though based on real facts):

```
Friend:  I've bought a new PC!
Me:      Oh?  What kind?
Friend:  Pentium 90, 8M RAM, 1G HD, quad CD-ROM, Soundblaster AWE32!
Me:      My goodness!  What are you into these days, designing airplanes?
Friend:  Huh?
Me:      I mean, what do you need that power for?
Friend:  Well, mainly wordprocessing.  Some reports for school, and
         some games of course.
Me:      But you don't need such a powerful system for that!
Friend:  But the salesman said that WP 6.1 for Windows would be too
         slow on anything less.  And there are some games already that
          _need_ a Pentium to run.  486 are for sissies.
Me:      So what's wrong with WP 5.1?
Friend:  But that's old!
Me:      So what's new in 6.1?
Friend:  Well, it's graphical, and there's something with macros...
         Much better, in any case.
```

It doesn't capture the spirit too well, I see, but you get the point. Somehow, 99% of all the PC users I know seem to think that, whenever version x+0.1 of any program comes out, the version x they have suddenly breaks down and can't be used anymore. Most are even prepared to buy a new computer system every two (approx.) years, just to be able to run the latest and greatest software. They have wordprocessors of which they demand that they can draw with, art packages capable of calculating spreadsheets, spreadsheets with DTP printing capabilities etc. Every program takes 20M HD space. Amazing how some people I know wanted to buy a new HD because theirs was `full', and had about 50% to spare after I deleted all the example files, QuickGuides, TurboHelp, Ultra-you're-a-dummy-and-I'll-show-you-how-to-point-the-mouse-on-a-button-interactively-multimedia-hypertext-helpsystems.

99% of PC users are _sheep_. They'd buy everything you tell them to.

Imagine this: In the docs of WP6 they actually write under `system requirements': To really work well, a 486/66 with 8M RAM and at least 16M swapspace on disk is required. Sick. For a wordprocessor, that is.

I'll stick to Atari for a long while to come.

Regards,

newsgroups: comp.sys.atari.programmer

Hi,

Lately I've been working on a simple AUTOEXEC-program that executes
the programs in the autofolder in the order specified in a .DAT file
(because I was experimenting a lot with the AUTO-folder order). It simply
extracts program names and commandlines out of an AUTOEXEC.DAT file
and executes those.

However, when executing MINTNP.PRX (note the X!), MiNT seems to think
it _does_ have MP switched on - and gets rather angry with GEM as soon
as that starts up (I wanted it to run w/o MultiTOS).

So I figured out that MiNT checked the filename and was confused by
the X (after all - you can't run a program called .PRX) so I made a
kludge to rename MINTNP.PRX to MINTNP.PRG shortly before exec()-ing
it, but that didn't help! I found somewhere in the Changes.MH-doc
that MiNT looks in the DTA of the parent, so I tried renaming
AUTOEXEC.PRG to MINTNP.PRG, but that didn't help either.

How can I persuade MiNT to keep MP off? Can I include a command line
option or something?

(Oh, and would anybody be interested in the program? It's really
simple, but you might have use for it)

Thanks in advance,

This thread has drifted from its primary subject (which is clearly described
by the title) to a debate about whether PC programmers are "lazy"
I won't enter this debate, as it doesn't belong here AT ALL:
o It isn't about atari computers
o It is not related to doom in any way

If you want to continue this very interesting (not!) conversation, please move
to comp.sys.atari.advocacy or one of the comp.sys.ibm.pc groups (how strange
that there is no ibm.pc.advocacy group!) or at least change the subject of the
thread.
But please don't post here any more.

Thank you very much.
Bye.
Bertrand

I realy pitty, and what is all this rubish about PC users having to upgrade,
its the same with Atari users..

I keep reading here that Atari users should get rid of their ST/STE's and get a slow Falcon or TT, well for what they are they are well overpriced and need a lot of hacks to make them work.....

I can go into a shop a buy a PC system and get full support and no Hacks, can you do that with a Atari, that is if you can find a shop on this planet called earth..

No the Atari and is OS is way way out of date...

If you don't go with progress then you get left by the way side...

Even the Atari OS developer John Townsend told you all here to go get a real PC with a Real OS..

    minus 13%... PCs have 87% of the market share..

>If software was so terrific on an Atari, why is then that no one uses atari?
>(don't blame atari bad marketing, there are more reasons, like the hardware
>being not good/powerful enough).

Why does everyone use VHS when BetaMax was (is) a better standard for VCRs (i.e. it has a bandwidth just greater than that used by the TV signals actually transmitted, whereas VHS falls about 1.5Mhz short)... Hardware, well the 680XX hardware is of superior design to that of the X86,X87 series chips, i.e. more orthogonal instruction set etc etc... but enough of the sad slanging match, back to what the thread was about, DOOM on the atari..

Now, anyone know how to get in touch with the guys (gals?) writing DOOMINO, which happens to be a 3D engine for the Falcon, not unlike DOOM, demo'd as one of the under 100k demos at the Fried Bits 3 convention, look for it at

<A HREF="http://www.mcc.ac.uk/~dlms/Falcon/falcon.html">Falcon Page</A>

under the New software section as

96kintro.zip -- 3 demos under 96K each from the Fried Bits III Convention 261K

it's the second demo (alphabetically) in the archive, it does a couple of things even DOOM and DOOM II can't do... seems to run fast enough to me..

Here's hoping,

Neil

No. It's about the time to speak out the truth... PC isn't a computer as much as it is a fashionable toy for people who don't have courage or knowledge to make individual decisions. I know people to whom PC is the best tool. For _them_ it's the best choice. But for the others, who just follow the majority, blindly... I pity them. I'm happy with my Atari - but I certainly know enough unhappy PC-users. They wonder: "I'm supposed to have the BEST there is... Why doesn't it then work well?". We all know those people, I guess. They ask you: "How come you still use that mummified Atari, when there are REAL computers available?". They think they're right - and we wrong. Still, they're unhappy (without knowing why) - and we aren't.. =-) !

Speaking of talking a load of rubbish...

Can't get parts? When I needed a new keyboard for my 1040, well, damnit
if I didn't find one! Then I needed a new power supply for same and --
hey, whaddya know? I found one! Then I needed a replacement for the
floppy drive in my Mega -- a specific drive, the one with the
parallelogram button on the front, and, well heck, found one of those, too!

For a machine I can't find parts for, I seem to have uncanny luck with
finding parts for it, don't I?

: The PC sells because it is marketed correctly and can be upgraded and has a lot

: of software and options going for it, the Atari is DEAD, did you not read
: what John Townsend posted....

Let's play a little "What he SAID was ... and what he MEANS is..." shall we?

What he SAID was...

"The PC sells because it is marketed correctly..."

What he MEANT was...

"The PC sells because it is marketed to computer-illiterate sheep by dealers who tell them that they need one and, being computer-illiterate but drinking in the hype that they need a computer like it was water, they buy everything the dealer sells to them at outrageous prices and think they got a pretty darn good deal out of it. Until they get it home and discover WHY these companies have 24-hour help lines, since the machine they just bought NEEDS 24-hour help lines ... and school courses ... and bible-length manuals, a technical degree, at-home service...etc"

What he SAID was...

"...it can be upgraded..."

What he MEANT was...

"...you can hack together some semblance of modularity that appears to work seamlessly until you have to look up what IRQ means, what this dip switch does, how to edit your AUTOEXEC.BAT nd CONFIG.SYS files, wht to change in your WIN.INI, etc, etc..."

What he SAID ws...

"...lots of software options for it..."

What he MEANT was...

"...lots of full-tower cases available to house those numerous, multi-gigabyte hard drives you will inevitably need to take advantage of the many software options there are because they every one of them take up more hard drive space than ten of the same applications on an Atari."

There. You see? You make a lot more sense when you clear things up like this.

: What users need is support , were is the Atari support in any form at all..

I guess all these Atari users are of absolutely no help to me, then ... they're not support, are they? Damn.

: Books, Clubs, Software, Updates and Repairs.....===NILL...!!!!

I've got books. I demoed a program I wrote at an Atari club meeting last

year. I _write_ software to be demoed at said clubs. I've performed any
number of repairs on my machine myself, and whaat I hvn't trusted myself
to do I have two fairly close (in the same city, that is) Atari dealers
who'd be happy to do it for me.

Is this what "NILL" means? I'm unfamiliar with the word, so I've had to
improvise here...

Atari have stated that their is a Good reason for not releasing TOS
to the PD..

Their would end up to many patched and adapted versions, and were would be
then, its like this Magic TOS, how compatible is it, from post I have seen here
its not that compatible...

I've been using such a program for years now. I can't remember where
I found it, but it included sources which I patched a bit.
The configuration file is 'programmable' in a limited way. You can let
it decide from a keypress on startup (without delay) what programs
should be started.
IMO this is much nicer than any of the 'boot managers' out there and
it doesn't move files around. The latter was very important to me
earlier since my STE had one of those infamous DMA chips:
When it got warm (usually after four or five hours) the computer would
start writing to the boot sector on the hard drive...
Not very nice to do at bootup!

>However, when executing MINTNP.PRX (note the X!), MiNT seems to think
>it _does_ have MP switched on - and gets rather angry with GEM as soon
>as that starts up (I wanted it to run w/o MultiTOS).

You're using FreeMiNT, right?
My current configuration script stopped working when I installed that
MiNT version.

>it, but that didn't help! I found somewhere in the Changes.MH-doc
>that MiNT looks in the DTA of the parent, so I tried renaming
>AUTOEXEC.PRG to MINTNP.PRG, but that didn't help either.

I keep all my 'AUTO folder' programs, including MiNT, in a folder
called AUTO_NEW. That should have worked with the DTA search.

I've looked at the sources, but I still don't understand why it
doesn't work. When I moved Outside from the mint.cnf to before MiNT
in the config file that caused the MP to be turned off, though.

>How can I persuade MiNT to keep MP off? Can I include a command line
>option or something?

Yes, if I recall correctly from my browsing of the sources, you can
use -M or -P. I think they are equivalent.

I'm thinking of hacking into the MiNT startup code to add a mint.cnf
switch for the memory protection. I guess there must be _some_ reason
why that isn't in there now, though.

>(Oh, and would anybody be interested in the program? It's really
>simple, but you might have use for it)

The startup program I use can't handle parameters, and naturally I
couldn't find the sources when I wanted to add that yesterday...

I'd very much like to modify your program to handle my config file.

Their is another reason that BETA MAX died, it was imposible to service them,
you need to be a watch maker and you need a lot of expensive tools..

A VHS machine is very easy to service...

Well that is the trouble really. Nothing worth quoting...

Mr Shepherd says so much in these areas which is ill advised and wrong, and he knows that there are areas especially designed for his mindset.

I think it should be said that Mr Shepherd is no Authority on the subjects he espouses and in fact he has an agenda all his own and quite anti Atari. He hates it when I say, with Authority that there are parts, clubs, books etc where Atari information is readily obtainable.

Our club in New Zealand is living proof that Mr Shepherd is a liar. He is more akin to a racehorse with blinkers on. Our Club Membership has increased especially over the past 18 months. The machines are reliable and are likely to be around for a few more years yet.

Mr Shepherd, these areas are for people who own and use Atari machines and are seeking advice etc. You are not interested in the "truth are you". You seem to have such a fanatical love/hate relationship with this brand, we wonder if it is a personal kind of "streaking" which you have no control over.

Just a couple of days ago I saved the following from r.g.programmer (IIRC):

>If anyone knows where I can obtain a few WAD browsers, I would appriciate a
>point in right direction. I am looking for realtime viewers, but they
>do not need to animate anything (doors, sprites, etc).

  Try DView.ZIP on x2ftp.oulu.fi. It reads WAD files, comes with source,
and will let you run around. It even renders floors as horizontal strips
as opposed to the easier but slow way, vertically.

That sure sounds useful!

I'd be interested in helping out on this project as well.
Image processing and emulators get boring if that's all you do. ;-)

Not rain on your parade or to put down anything you have done, but why
not just reorganize the AUTO programs with a program that does so. That
way a special execution program is not necessary. There are many
different utilities out that offer AUTO folder reordering.

Why try to invent a machine to open doors by pulling out the hinge-pins,
when all that is necessary is to turn the door-knob?

Rich

Can they all send parameters?
How large are they?
Do they take extra time on bootup?

>Why try to invent a machine to open doors by pulling out the hinge-pins,
>when all that is necessary is to turn the door-knob?

IMO the reordering is the 'pulling of pins'.
What could be easier than a list of files to execute?
On older machines you also need special programs to see what the order
is, since the normal desktop can't show it.

In general, I think that the concept of a significant 'order', totally
unrelated to anything obvious, in a filesystem is _bad_.

Another thing I really dislike is the way so many programs force you
to put their configuration files in the root on the boot drive (or C:\).
Together with all the enabled and disabled ACCs, I must have a couple
of dozen files cluttering what for many people would be the _only_
root directory. I'm glad I have 11 more!

By the way, the memory protection switches I mentioned for MiNT should
be lower case. (I added a new command for MINT.CNF myself this morning.)

Subject: Calling AES in subroutine
Date: 1995/07/23
Message-ID: <3utrth$2r4@news.mdata.fi>#1/1
X-Deja-AN: 106770742
organization: Megabaud Oy,Helsinki,Finland
newsgroups: comp.sys.atari.programmer

How can one call AES in a subroutine that has been started
in the same address space in MiNT (eg. with troff from mint lib) ?
I couldn't get the thing to work, the program would just
crash or do nothing when AES was called.
Like this kind of program:

```
#include <support.h>
#include <osbind.h>
#include <aes.h>

short mes[8];
long ap_id

main()
{
     ap_id = appl_init()

     troff(new_sub, 0);

     evnt_mesag(mes);
}

void new_sub(long arg)
{
     mes[0] = 1238; /* no matter what you put */

     shel_write(ap_id, 16, mes);

     /* or any other AES function, like form_alert... */

     for (;;);
}
```

And it doesn't help at all even if you try to init AES using
appl_init in the new_sub routine..

Is there any trick to get this work? Or is using AES together
with MiNT really this impossible? The basic problem I have
is that I need to wake the main procedure from event_mesag
call from the sub routine.

Regards,
Arto Jalkanen

I have heard that Atari won't be releasing these TOS versions/MultiTOS
to public domain because Atari has to pay some royalties for every
copy of TOS to DR. At least this was the case with MultiTOS, when it
was released (everyone remember Bob Brodie trying to get MultiTOS
to be released in the PD ?).

Have you seen EKO's latest demo "EKO SYSTEM". It have a Descent lookalike part.

Okey there is no texture mapping, but it's VERY good and fast! I would say atleast 25 fps if not more. :))

 >> it's the second demo (alphabetically) in the archive, it does a couple
 >> of things even DOOM and DOOM II can't do... seems to run fast enough to
 >> me..
 BLR> Yes, just fast enough on a basic falcon

Does it support an accelerated falcon? A 40MHz CPU and 50 MHz DSP would make it even faster!

 BLR> People are starting serious work here. If you want to join the effort,
 BLR> your help is welcome. We take this project quite seriously, and need
 BLR> people we can rely on.

What do you mean with this? Are you saing that you are working on a "DOOM" clone (I would prefer a Dark Forces clone if possible)? :))

I hope you are as we need some good games for the falcon. Especially if the rummors about Atari having started to produce the falcon again! :)

cheers,
Magnus kollberg

You are right that Atari will not release any version of TOS as PD.

However, the reason you gave is incorrect.

The real reason is that THEY MUST PAY A ROYALTY TO _Digital_Research_Inc_
FOR EVERY COPY OF GEM CREATED/SOLD/GIVEN-AWAY!

This reason was given by Atari themselves (in "Dateline Atari" about
1991/2).

If they did not have to do so, they would have made TOS (including any GUI
it may contain) a freely distributable program.

I hope somebody can help me.
I am trying to compile freemint (1.12 h4), and I have been unable to compile
it with GCC. I used GCC 2.3.3 (I also tried with 2.5.8 with the same problem).
I used the libraries pl 46, and linker from utlbin38.

No matter what I try, I get several undefined symbols in the link phase.
This is weird because I was able to compile the source with other compilers and
they did not complain about those symbols (but MinTs compiled with other
compilers had other problems I won't get into).

Can anybody tell me what I need to define the symbols missing below?
Thank you very much.

Yes, the "-m" and "-p" options to MiNT turn off memory protection.

("-mw" or "-pw" do so, too, and additionally suppress the ugly warning message.)

As for looking at the name of the MiNT binary: Renaming the binary won't help because FreeMiNT doesn't actually search in "\auto". The current logic (as of FreeMiNT 1.12.4) is to look in the parent's DTA for the last file name that had been Fsfirst()/Fsnext()'d and to turn off memory protection if it was "MINTN*.PRG" or "MNTN*.PRG".

(This kludgy behavior can be turned off by #undef'ing AUTO_FIX at compile time, thereby activating the old "\auto\mintnp.prg" method. However, renaming the executable still won't work because MINT searches it too early in its boot process.)

Counting executable names ending in "*.PRX" would be a bad idea because most people use it to disable AUTO folder programs.

Does anyone know how to get the language the ROM is in on ALL TOS Roms. (I know about the cookie jar ones from Rainbow TOS)..

the ox_conf variable in the os_base as pointed out in the Atari User documentation says that will do it, but that comes out with a value of 255 (which as I understand can't be right..)

The programme profile comes up with the same result..

_set_mmu, _setstack, _save_mmu, _restr_mmu and _cpush are all defined
in the file cpu.spp, which should have been compiled into the cpu.o at
the end above.

Something must have gone wrong with the compilation of cpu.spp.
Check if cpu.o is empty for example.

Ah, but e_gem it self does all that, but I think there is a bug in it, at least
preventing it to work properly under GNU C..

OK, so I have a sound chip that can generate the individual frequencies,
and it has more that enough channels to play 2 tones, but I can't
seem to persuade GFA Basic to play more than 1 note at a time. I can
play 1 note on one channel or on lots of channels, but when I try to
play a different note on a different channel, the first note stops.

Help, ideas, listings, etc much appreciated. please mail as I can't
read news as regularly as I'd like to.

I don't know, but OUR project will run on any falcon. The user should be able
to choose the resolution and the size of the screen, from the fluid little
window to the overscan one. Of course, it should work on any configuration
with a hard drive and a VGA or RGB monitor. And if people have very fast
falcons, why not use the ScreenBlaster and BlowUp cards?

Yes. The idea is to make a doom clone that can read the WAD files of doom, and
communicate with PC, Mac, etc. based users. Dark Forces... Well, if Dark
Forces were a WAD. But it's not. And it needs a CD-ROM. Let's first do doom.

Is anyone seriously interested in a little Pure-C library to
do 'thread-like' programming ?

I wrote something like this just for the fun of it, but I
ain't got no real use for it at the moment.

If there's some feedback, I'll type a little usage info and
post the stuff here. Its only 16K source. UU-Compressed probably
4K. The idea will be that I give the source out, maybe do
a little initial handholding but basically I don't want to
'support' it. I think you can use the thread library quite well
in GEM programs, where each window is a thread, and a
cleverly adapted evnt_multi then dispatches the threads.

Nat!

P.S. here's a small demo source (you could also link an interrupt
into the dispatcher, to get preemption).

```
#include <nat\ndefines.h>
#include "thread.h"

thread   x, y;
```

```
void  routineA()
{
   Cconws( "routine A\r\n");     /* exits soon */
}

void  routineB()
{
   for(;;)
   {
      Cconws( "routine B\r\n");
      thread_yield();
   }
}

void  routineC()
{
   for(;;)
   {
      Cconws( "routine C\r\n");
      thread_yield();
   }
}

main()
{
   thread_run( &x, routineA, 0);
   thread_run( &y, routineB, 0);
   thread_run( &x, routineC, 0);

   for(;;)
   {
      Cconws( "routine D\r\n");
      thread_yield();
   }
}

/* Output will be something like:

              routineA
              routineB
              routineC
              routineD
              routineB
              routineC
              routineD
              routineB
              routineC
              routineD
              ...
```

```
*/

P.P.S.:
     When running on interrupts, the library is a bit problematic
     in programs that use TOS calls heavily, because a context
     switch will only be done, when the program is executing
     in user program space (and user mode). So in effect you'd
     still need to do some thread_... calls in your thread code.

Strange, I remember that Atari actually bought the rights to use Gem 0.9
at a time when Digital Research was out of money? Are you sure that
Atari pays royalties, or is it so that they are just not allowed to pass
the rights on to other organisations?

There is a special value which means 'support all languages' which I
understand is used in the Falcon ROMs.

I checked out Doomino the other day after talk here and must
say that I was very impressed. If this is made into a playable
game I would be very happy.
Regarding attempts at Doom-like games what do people think of
Lasers and Men? I personally disliked it because I found
the playability awful. Please keep this in mind- make the game
fun to play (I know, easier said then done). Heck, I'd love
to just see a Wolf 3D clone. That is a great game even if
it isn't the newest thing around.

This comes up from time to time. Now whereas I believed this to be the case - other people seem to think that Atari bought out the license from DR to avoid this royalty problem - and also let them develop GEM as they saw fit.

The real question - is does anybody actually *know*?

> This reason was given by Atari themselves (in "Dateline Atari" about
> 1991/2).

Is it still true now I wonder? Was it even true then? ;-)

> If they did not have to do so, they would have made TOS (including
> any GUI it may contain) a freely distributable program.

I think Atari (IMHO) are too disorganised - and entirely unbothered at clarifying this situation and making it available even if they do own the rights.

:-(

Roland.

: appears that they could care less right now.

A point to consider on the first paragraph. You will notice a copyright message dialog box in its typical selection above the desk accessory slots from within the Desktop. It claims Atari's copyright date 1985-1994 and its Digital Research notice. It satifies all international treaty and USA law requirements for Copyright claim. It states the NAME of the copyright holder(s), the DATE, and either the word "COPYRIGHT" or the copyright symbol. Typically all of the "allied" countries honor this treaty.

Just a bit of legal info.

I am interested in creating a program for my Atari computer. So
far I have the rough draft. I was wondering if anyone could help
me with a couple of things. I will type my program out, so that you
can examine it.

```
10 REM AZTEC
20 PRINT "Do you wish to connect to AZTEC?"
30 INPUT A$
40 IF A$ = YES THEN GOTO 60
50 IF A$ = NO  THEN GOTO 70
60 CALL 965-4151 or DIAL 965-4151
70 END
```

That's my program so far. As for line 60, I am not sure what commands
you would use for dialing into a computer. Can anyone help me?
Also, I don't want to type in my login name everytime I log in the computer.
Does anyone know how to program the computer to do it? Any help would be
appreciated a lot. One more thing, how do you save the program to a disk?
Bye and have a nice day. Please email ASAP! Thank you.

Hello !

Have anybody any idea how to change
NVRAM in Falcon from GFA ?
I Like to change my keyboard layout to
Finnish if it's possible.
On cookies is mentioned that (_AKP 10=FIN), and I
suppose that changing byte in $07 on NVRAM to
$A is the trick.

I tried XBIOS(46) call:

```
check%=XBIOS(46,W:0,W:7,c)
```

to check what is in there, but all I get was
bombs. Maybe I work it out later...

Well, if E_GEM opens your workstation, it must use a particular function to
do so, why not avoid it and write your own.

I haven't used E_GEM (yet) so I really don't know about it's capabilities.

Phil.

> The programme profile comes up with the same result..

The value in the os_conf byte in the OS header needs to be interpreted as
two separate values : the top seven bits give the country number, whereas
the bottom bit gives the PAL/NTSC flag.

As such, the value 255 says : country is 127, PAL.

Country 127 means "All countries/languages supported". The only TOS
version(s) with this info in it are TOS 4.x in the Falcon.

Previous versions of TOS are country/language dependent.

It would be helpful if you told us what kind of Atari computer and the programming language you are using. This looks like good ol' Atari BASIC for the 8-bits.

You need to add double quotation marks around the string variable values in lines 40 and 50 to make it work:

```
40 IF A$ = "YES" THEN GOTO 60
50 IF A$ = "NO"  THEN GOTO 70
```

And as far as line 60 is concerned, methinks that might me a bit over your head as a beginning programmer. But if you really wish to pursue it, you might also check in comp.sys.atari.8bit as that's where most 8-bit Atari users hang out. I don't remember enough Atari BASIC to help.

The comamnds depend on which version of BASIC you are using. Basically you want to print a string to the serial (AUX) port to get it to dial. The string needs to be something like:

ATDT phone-number

> I don't want to type in my login name everytime I log in the computer.
> Does anyone know how to program the computer to do it? Any help would

Much the same thing. Just a case of printing your login name to the serial port at the appropriate time. It gets a bit more tricky if you want the program to look for the 'login:' prompt.

A point to note though is that although the basics are fairly simple - it gets quite complicated, the more features you add. If you are programming this because you want the experience then all well and good. However if you don't care - and just want the facilities - then you might find a terminal emiulation package which has most of this built in anyway.

> One more thing, how do you save the program
> to a disk?

This too depends on the version of Basic you are using. Usually under the 'FILE' menu in the menu bar.

:-)

Roland.

Another advantage of making a compatible clone of Doom on atari (even if it's without textures) is that it could use the same protocol to play on a network.

We could duel with people on PCs, Macs, NeXTs, and so on.

So here is I think a reasonable project: a filled polygon universe with scaled sprites for the monsters and objects, compatibility with WAD files (perhaps after getting rid of the texture part of them) and compatibility with the communication protocol of Doom.

Does anybody find this interesting enough to start working on the project?

Bye.
Bertrand.

Does anyone out there have .FLM or .SEQ source code they are willing to share or trade? I would really like to include some small animations in a program, but my time is too short to validate starting from scratch.

Any help would be great.

keywords: C, Pascal, 68000, assembler, assembly, printf
newsgroups:
comp.sys.mac.programmer.misc,comp.sys.amiga.programmer,comp.sys.atari.programmer

Hi.
I just recently learned a little 68000 assembly language for the Amiga. But I suppose the following questions can be asked of Mac & Atari assembly language programmers as well. My question is, can one access C runtime library (libc.a) functions from assembly language? If this is possible, how exactly will the functions parameters and return values be passed to and from the functions in assembly language? For example exec.library's (an Amiga Dynamic Link Library) OpenLibrary() function prototype in C looks like the following:

```
struct Library *OpenLibrary( UBYTE *libName, unsigned long version );
```

And looks like the following in actual C source code:

```
/* Open intuition.library, any version.  Return library base pointer. */

     IntuitionBase = OpenLibrary("Intuition.library", 0);
```

In assembly language, the OpenLibrary function requires that the pointer to the library's name string to be in register A1 and the version number

of the library to be in register D0. The function returns the library's base pointer to register D0. Example as follows:

```
DC.B LIBNAME       'Intuition.library',0  ;NULL terminated string
DC.L VERSIONNUM    0             ;0 indicates any version

     lea  LIBNAME,A1             ;Address of string to A1
     move.l   VERSIONNUM,D0          ;Version #to D0
     jsr  _LVOOpenLibrary(A6)         ;call OpenLibrary()
```

* A6 contains the exec.library's base pointer.
* _LVOOpenLibrary is the Library Vector Offset (LVO).
* D0 contains the function's return value.
* D0 will contain a pointer to intuition.library if OpenLibrary() was
* sucessful. NULL otherwise.

Say I COULD to use something like the printf() from the C runtime library, how would I do the equivalent of something like printf("Hello, World!\n"); (in C) in assembly language? Where would the function's arguments and return value be stored? I have heard that Pascal uses a different calling convention than C. If C runtime functions CAN be called from Assembly language, can Pascal runtime functions be called as well? If so, how? Thank you for taking your time to read this. Please respond by e-mail if possible to leungs@eden.rutgers.edu. Thanks again. Bye-bye.

By golly, how would PEOPLE like it if animals bulldozed a suburb and put in new TREES?!?

Sure!

>If this is possible, how exactly will the functions parameters and

In general, C code uses the run-time stack to pass parameters and
return values between functions. Probably the best way to see how
to set up a call to a C library function is to compile a short example,
and take a look at the code the compiler generates. Most compilers
have a switch that cause the compiler to generate assembly language
instead of an object or executable file (for gcc, that flag is -S).

>In assembly language, the OpenLibrary function requires that the pointer
>to the library's name string to be in register A1 and the version number
>of the library to be in register D0.

Right. Usually, what's done is that when you call OpenLibrary (or
some other OS function) it calls a library function like this:

```
     _OpenLibrary  movem.l  a1/a6,-(a7)   stash registers
              move.l   12(a7),d0 grab version off stack
              move.l   8(a7),a1  grab lib name off stack
              move.l   #4,a6
              jsr  _LVOOpenLibrary(a6)
              movem.l  (a7)+,a1/a6   restore registers
              rts
```

This sort of thing is usually called a stub, or a wrapper function.
The thing is (unless you or someone else tells it), the C compiler
doesn't know OpenLibrary is a special function and needs to be
called in a special way. The simplest solution is to provide the
above code, and the compiler can generates calls to OpenLibrary in
the same way it generates code for other function calls. Of course,
this isn't as fast as you can get in raw assembly language, but then,
that's the nature of using a high(er) level language.

Simon,

What is your system config? Is your GCC setup under TOS, MiNT or Linux?
If you have an '030 machine and are not developing for GEM, I'd strongly
suggest setting up Linux (I have no probs debugging c++ progs compiled
under GCC 2.6.3).

C would do fine. Could anyone recomend such a library ? What about
getting menu bars in windows. Can one simply poke about in an object
structure and change the coordinates or is it nastier than that ?

Thanks,
Giles.

Hello. I would like to introduce myself. My name is Paul
Bragiel and I live in the Chicago suburb of Barrington. I will be

heading off to the University of Illinois next year to study in Computer Engineering. But before I leave I am holding a competition in my area for enthusiasts in the area of game/demo programming. We will have artists, musicians, and programmers from the area come and meet at a site to be named. We plan on holding this even during the middle of August before I leave to college. What I am trying to get to is that we need a company or two to help us in my crusade to pull this competition off. What we currently need is a projector that would be able to plug into the back of your PC and display 640x480x256 projection. We also need help in acquiring a good sound system that will be able to exploit the great music that will be produced and finally we need money to help us fund the site we plan on holding it or we need help in ataining a site. If anyone can help me I would really appreciate if you could contact me at pyro@xnet.com

C pushes the parameters on the stack from right to left, so that the first
parameter is always on the top just before the actual call. This allows
functions with a variable number of parameters to work (like printf), which
you cannot do in pascal.

The return value is in D0, unless it is a floating point value or a struct.
I'm not sure what happens if the return value is a pointer - maybe it goes
into A0 then.

The caller function is responsible for restoring the stack after the call. In
pascal, the called function is responsible. This again allows variable
parameter functions, but the pascal method is a little more efficient, as
most functions get called from more than one place in a program, and C requires
a separate tear down for each call made.

So your printf("Hello, World!\n"); would be something like this:

```
@helloStr
     dc.b 'Hello, World!\n'
     dc.b 0

     pea  @helloStr
     jsr  printf
     adda #$4, sp

     move.l   do, result(a6)         ; result is a local var
```

I cheated here by allocating the string within the code space. You'd need to use

```
     pea  helloStr(A5)
```

if the string were a proper global.

How to change 50/60 Hz mode in GFA Basic ?
Or to make bootsector which do the job ? (Assembler/Gfa)

I need to know because my TOS ROM:s are in 60Hz mode
and my TV can't cope with that.
I know the address &HFF820A, and bit XXXXXX0X which I should(?)
change but it don't work?

Or can I change some bits in TOS ROMs ?
All I need to know is the place in ROM:s ?
My brother have EPROMMER which will do the job.

Having actually programmed a game for the Falcon makes me think that it could be done. The WAD are just data. You could make a 2d game out of it easily and a 3d game a little harder. Off course it would not be DOOM, but the idea of using the WADs is quite interesting. With a smaller screen lower rez and lower fps and 16 bit graphics instead of 8bit it could turn out to be a great game.

Joost.

>you used to do this?

It seems I have a problem with my mailing address....
Ok, I'll try to remember what I did that day. First, here is what TOS I have:
I got a disk with the TOS image and a program to make a bootsector on this disk
to boot TOS 4.92. At least my version ONLY boots from floppy. (A:). To change
it into MultiTOS, you should have MiNT installed and in the configuration file
a line like INIT=C:\MULTITOS\BOOTGEM.PRG. BootGEM is a program that was
delivered with MiNT 0.95 to start up the ROM-GEM. To make the TOS think it
booted from hard disk, you have to write (or have) a programunzip
 (e.g. CBOOT.PRG) that sets _bootdev and the actual drive to your boot
partition (C:).
This will force the TOS to load the AUTO-folder and accessories from hard disk.
Create an AUTO-folder on your TOS 4.92 disk, and copy FIRST your hard disk
driver and then CBOOT.PRG there. That should do it.
I can't say for sure, because my hard disk died a week ago and so I can not
review anything exactly. :-(
If you want to load TOS 4.92 from hard disk you need another program, that is
capable of loading and running a TOS-image. I think I used TOSLOAD from the
TurboAss package and patched it, to load a 512K file, but I can't remember.
If you encounter any problems feel free to mail me at schoebel@rz.tu-ilmenau.de
(that should work).

BTW: Has anyone accomplished starting TOS 4.92 entirely without a floppy?

I'd be glad to hear it... (and how ,-))

It is *MUCH* nastier than that. :) Poking around just gets us very dirty
programs that will crash the system. It won't work either...

>my guess is, it won't happen: atari hardware is not powerful enough.

Hi ho, now let me see, lets check out the power given by the DSP, well it's clocked at 32MHz (the only number I remember right now), but I suspect that if you wrote a Falcon only version you could quite easily get Doom up and running, using the DSP... a Falcon is equivalent to at least a 33Mhz 386DX if not better when you combine the given power of the 68030 and the 56001 (accounting for the loss due to data comms between the two)...

My guess is it could be done, but no one will invest since Atari's "support our TOS based machines ? what TOS based machines ? We sell consoles."

Ho hum, gloom,

Neil
(nab@comp.lancs.ac.uk)

Oh yeah, roughly how much money and bother is there involved in getting a FPU for my Falcon anyways.. or should I be asking this in comp.sys.atari.st.tech ?

Thanx in advance..

Richard John Kelsch (richcsst@crash.cts.com) wrote:

: : Where can I get AES 4.1, Rich?

: You can't...

No, you definitely can. As it's not commercial software, but still under

some copyrights, nobody can openly give anyone one. But it shouldn't be
impossible, or terribly devastating for anyone to send a copy on 4.1 to
people who'd like to test it. I believe, someone here will help...

Refusing to give someone AES 4.1 because it's "illegal" is not (IMHO)
just honesty, but stupidness - because nobody supports this software any
longer, nobody loses money - and many people need software like this...

We have to be honest enough to respect and support our software
developers - but being _too_ honest might destroy us... Single-mindness
isn't a good thing, because world just isn't black and white.

A Falcon should be easily capable of doing the texture mapping too, since all the heavy mathematics involved in 3d graphics are an ideal application of the DSP. As long as the data transfer through the host inteface can be managed at speed, a Falcon should be far more capable than a PC at it.

Not that I'm offering to do it... :-)

Doom on the ST/STe eh? Well here's my 2cents worth, sure it could be done.
Hell, I could give it a whack, problem is I don't have the financial backing
to code such a monster project. I would guess a GOOD Doom clone running on
8mhz STe's could be hacked out. I would suggest a smaller viewing area and
try for a target frame rate of around 10-12 frames per second. Using ALL
16 colors. From the little I know about 3D coding, a limited version of the
popular RAY CASTING method could be used to achive the re-draw?? I havn't
got a clue really. :) The biggest problem imho is not the technical
limitations of the machines, but the TIME and the MONEY needed to actually
code the thing. I would guesstimatethat at least 6-8 months would be
needed to code it. And quote frankly unless some college student wants
to code it over the course of his school year, I don't see any serious
coders spending this long on a Atari specific project. But I do feel a
GOOD doom clone is not out of the question for the STe line.

From: Timothy Miller <millert@csee.usf.edu>
Subject: Need help with MiNT stuff
Date: 1995/07/14
Message-ID: <Pine.SUN.3.91.950714175911.7970A-100000@grad>#1/1
X-Deja-AN: 106178205
organization: University of South Florida
x-sender: millert@grad
content-type: TEXT/PLAIN; charset=US-ASCII
mime-version: 1.0
newsgroups: comp.sys.atari.programmer,comp.sys.atari.tech

Could someone who knows MiNT tell me why this particular combination does not seem to be able to get me a modem channel that DOESN'T echo all input back to the modem?

```
struct sgttyb {
     char sg_ispeed;
     char sg_ospeed;
     char sg_erase;
     char sg_kill;
     unsigned short sg_flags;
};
#define T_CRMOD        0x0001
#define T_CBREAK   0x0002
#define T_ECHO         0x0004
#define T_RAW      0x0010
#define T_TOS      0x0080
#define T_TOSTOP   0x0100
#define T_XKEY         0x0200        /* Fread returns escape sequences for
                          cursor keys, etc. */
#define T_ECHOCTL  0x0400        /* echo ctl chars as ^x */

     mdev[num] = Fopen("U:\\DEV\\MODEM2", 2);

     Fcntl(mdev[num], (long)&sometty, TIOCGETP);
     sometty.sg_flags = T_RAW;
     Fcntl(mdev[num], (long)&sometty, TIOCSETP);
```

So, now, when I Fread something from mdev[num], everything it echoed back to the modem, even though the only flag that's set is the RAW flag.

So, what's missing?

Could someone forward this to the MiNT list and make sure they get my

email address below?

Thanks very much.

But isn't it also a Federal crime for you to possess it in the first
place, whether you distribute it or not?

>it in Czechoslovakia before the server went down. I'm not redistributing
>it. I'm sure some shadey character put it there.

OK, it is still copyrighted etc AFAIK, but seeing as it will never be
released, or making money in any other way for Atari, I'm sure they won't
mind people distributing it, thereby keeping some kind of interest in
their machines.
All this is IMHO of course.

Phil

: isn't a good thing, because world just isn't black and white.

WRONG!!!

Despite the fact that Atari no longer develops TOS does not make it any
less wrong to violate their copyrights. Copyright gives them the right
to NOT sell it and distribute it if they so wish. TOS is the property of
Atari and will remain their property for 75 years or until they sell it
or release it into the public domain (if that should ever happen).

Yes, someone does lose money...Atari and C-lab. C-lab has an exclusive
agreement for the use of TOS of which they PAID for.

You're right, the world isn't black and white. It's called RIGHT and WRONG.

I wonder how many programs that you own that you actually paid for...

A few notes about Doom, firstly there is a Doom FAQ and a technical Doom FAQ available (can't remember where but the Doom newsgroup could point you to it). The technical Doom FAQ gives a complete description of the format of the WAD files and how they are made up.

Secondly did you all know that Doom is only 2D. I know it looks 3D but the data used for Doom is stored using a BSP tree and is in fact 2D. What you have is a flat plan (as you see on the map) but there are heights associated with the flat objects. There is also a floor and ceiling height so you define a room with a floor an object of height (x) and a ceiling. The idea is that a wall is a flat object with a height from the floor to the ceiling. This is also how walls can slide up and down, the ceiling height in that area is changed.

Now I don't have all the details to hand and I certainly don't have the programming knowledge but the fact that Doom is only 2D makes it far easier to do the calculations than people imagine. Also ever wondered why in Doom it wasn't possible to say stand on a ledge and to have say an alcove underneath you, well the answer is it isn't 3D, it only 2D and the way it is defined you can't have multiple levels sharing the same space. Thats why the maps are all flat.

This kind of thing should be possible to some extent on at least a Falcon. With or without texture mapping it might be worth someone trying what I've said out creating an engine and optimising it on a Falcon. See what speeds you get, add some scaled sprites, see what speed you have then. Add in simple game logic and see what the speed is, and if it still flies fully optimise the code and try and introduce, shading or texture mapping, even if only spot texture mappignis added onto shaded walls.

Face it the Amiga 1200 isn't as powerfull as the Falcon and that's got 3-4 Doom clones coming out. In those cases they use a smaller screen and increase the pixel size by around a factor of 3 so you get a blocky display that moves fast as it doesn't have too much stuff to calculate and move around. If this can be done on a 68020EC then a Falcon with a 68030 and DSP should be able to do much better.

BTW Towers II which uses a raycasting engine (to my knowledge), in the same vain as Wolfeinstein only uses the 68030 and doesn't make use of the DSP for any 3D calculations. It runs in True Colour which is also a fair bit slower than 256 mode.

There must be someone who knows his apples who can come up with something. Just some food for thought. Bye!

Problem is that same program works great with tos 2.06, Geneva and Mag!x. But on tos 1.4 it just don't register double click. Click timing etc all tested but problem still exist.

William

OK, I have the TAF distribution from Compuserve. I have installed it into my system.
NOW, HOW DO I CONFIGURE IT TO USE COMPUSERVE'S PPP GATEWAY! I cannot even get my machine to ping itself via the loopback. I am not about to try to go "on-line" until I can ping myself, telnet to my own machine, etc.
Also, how do I tell Xwindows to run in TT medium rez. Can I run X along side of GEM?

I'll answer this one via CISmail, since not many other folk are using CIS' PPP. It's just a matter of modifying a file called chatfile so that it goes through the CIS login sequence and does a GO PPPCONNECT.

Dunno.

> Can I run X along side of GEM?
No. Although if you have stacks of RAM there is a package which simulates GEM under X ...

When I try to ping my TT on the net address I gave it, it says "Network unreachable".
I try to add my machine to it's own routing table and I get "Network unreachable".
I can ping to the Loopback port 127.0.0.1 fine, but cannot ping 100.0.0.1.

Next, when I connect to the Net, I get in OK, but I cannot FTP/TELNET/PING anything
other than my own system (Which mysteriously gains the ability to ping itself at 100.0.0.1, even though no data is going over the modem to CIS.) However, attempting to ping
compuserve fails. Attempting to ping umich fails. Data goes out over the modem, but no data ever comes back. What am I doing wrong?

: you report this to Atari...??

Your point???

: Lets be real no one losses out from a copy of unsuported crappy OS do they,
: so why not get real, are you GOD...!!!!!

Again, your point?? What does obeying the laws have to do with being God? Once again you must have let your brain ooz out. Atari gets royalties from sales of C-lab Falcon's. These royalties apply to both TOS and hardware. The Lexicor pays royalties for use of TOS in their Medusa. The makers of the Eagle will pay royalties for TOS. Sellers of TOS ROMs pay for the priviledge.

Just because Atari no longer manufactures home computers and no longer develops TOS does not mean they do not earn money on TOS. It's stupid self righteous dipshits like you that make developers not want to develop. Why bother when some asshole says it's ok to distribute because he says so?

Just because Atari computer users got butt-fucked by Atari still doesn't mean they have the right to violate their copyrights.

I feel sorry for your children, if you have or will have some. A bunch of lawless and self righteous little assholes running around brings chills to my spine.

: if you get rid of the textures, you get rid of the largest part of the files.

This is one of Microsoft's excuses for producing the dreadful crap that
it does. Cheap? Really? Then why don't I own several of them?

Wouldn't it be nicer if Microsoft programmers had a clue about compact,
fast code? Maybe then we wouldn't need 1 gig of HD, 32 megs or RAM, and a
500mhz Pentium just to run a word processor at half my typing speed.

So, now you're using the same excuse. Are you a lazy programmer that
wastes time and space at every turn just because you don't feel like
taking an extra minute to make your software GOOD? If you're that lazy,
you should program for Mac or PC. If you have a clue and some ethics,
then program for Ataris.

I think that's a little unfair it is a first attempt what do you expect
a doom better straight off :)

Even in the early days of Wolf3d and Blake Stone you had the problem
of being able to move around fast enough to play while still maintaining
a smooth action. Which meant Gourad Shading and Switching off the
ceiling and floor to regain so level of speed.

Granted there are a few problems still evident suchs as the slightly
dodgey looking shapes of the creatures and the fact you can't get nearer
than 8 feet to an object. But it's still early days yet.

Paul :)

I would encourage anyone who has successfully modified their chatfile for
a particular service provider to post their chatfile (minus password) as this
will certainly help out other users.

>> I cannot even get my machine to ping itself via the loopback.
>> I am not about to try to go "on-line" until I can ping myself, telnet to my own
machine, etc.

I inadvertenly left out the loopback dummy driver in c:\mint - you may want to
download the latest mintnet (0.72) and update all the mintnet files. You cannot
telnet your own machine unless you run inetd and have all the local daemons
(telnetd,etc) running. This wasn't included cuz it takes a LOT of extra RAM
which most people seem to be short of. You can download everything from the
popular ftp sites.

>> Also, how do I tell Xwindows to run in TT medium rez.
>Dunno.
The X port is for mono modes only - you must have the TT set to ST-high on a VGA
monitor (or TT-high if you have a 19") before Mint runs. Icd booter has an
option for this - Xboot does as well (I think). Color support may come later.

OK, so I have the TAF distribution (nominally) installed. I have edited my
chat script so that I can call Compuserve's PPP server and get connected.
HOWEVER, any time I try to do ANYTHING over the network, NOTHING happens.
I see DATA going out to the modem.
I DO NOT see DATA coming back.
I can use the CIS PPP server with the KA9Q package, so I know it works.
IFCONF on PPP0 shows that compuserve is connected.
ISTATS shows that 4 of the received packets were dropped due to bad checksums.

INFERENCE: Once I have connected the PPP link, CIS does not like any of the
packets I am sending, and is not replying.

Since I cannot get Chimera to work until I solve this problem, I am SOL.
SOMEBODY, HELP ME! I know people have this working, so it must be something
simple. Could somebody who is using CIS send my their config files so I can
get this to work?

: : : : Where can I get AES 4.1, Rich?

: : : You can't...

: : No, you definitely can. As it's not commercial software, but still under
: : some copyrights, nobody can openly give anyone one. But it shouldn't be
: : impossible, or terribly devastating for anyone to send a copy on 4.1 to
: : people who'd like to test it. I believe, someone here will help...

: That, my friend, is called piracy.

I knew _somebody_ would say that... I, however, disagree. What are laws
made for? For being obeyed blindly? Or for helping people to live? If
I, for example, gave a copy of AES 4.1 to someone - and someony informed

the authorities, and they'd sue me... What good would that bring to anyone? How great a sinner would I be doing that? Don't talk about "piracy" - talk about what needs to be done to keep Atari world alive!

: : Refusing to give someone AES 4.1 because it's "illegal" is not (IMHO)
: : just honesty, but stupidness - because nobody supports this software any
: : longer, nobody loses money - and many people need software like this...

: : We have to be honest enough to respect and support our software
: : developers - but being _too_ honest might destroy us... Single-mindness
: : isn't a good thing, because world just isn't black and white.

: WRONG!!!

: Despite the fact that Atari no longer develops TOS does not make it any
: less wrong to violate their copyrights. Copyright gives them the right
: to NOT sell it and distribute it if they so wish. TOS is the property of
: Atari and will remain their property for 75 years or until they sell it
: or release it into the public domain (if that should ever happen).

I can't say you're wrong, but I still disagree. Do you consider me a criminal, or a pirate, because of writing these kinds of opinions? It is true that Atari owns the copyrights. But it is also true that Atari hasn't respected our, their customers' rights to be supported. I don't see that they can demand much loyalty from us any longer, after acting like they did.

Someone has said that "those people who meant the best sometimes made most harm...". I think, that you mean good - but if you (just for principle) prevent Atari users from getting an improved, un-supported OS, you're honest - but at the same time you're hurting many people.

It's good that we're mostly honest people compared to many other computer users. Most PC-users I know, really have _not_ bought one single piece of software. We do. But those PC users don't seem to regret their behavior at all, or even think they're "pirates". They do as other people in PC world do! We're angels compared to them, let's face it! Most PC owners would just laugh at this conversation. And still, we have to support our developers to stay alive ourselves. I do want to respect your attitude - but somehow I feel that if we act 100% clean, we'll end up being some kind of martyrs/saints who'll die knowing "I did the right thing!". And that feels pretty stupid to me, can't help it.. We NEED a good OS. AES 4.1 is one. If Atari won't sell it, I won't be the first to throw a stone at someone who gets it illegally. But we all have to act like we feel is right, I guess.. It's always too easy to judge others, isn't it?

: Yes, someone does lose money...Atari and C-lab. C-lab has an exclusive
: agreement for the use of TOS of which they PAID for.

Atari doesn't lose money. And what comes to TOS, I asked in this newsgroup some time ago, whether they have rights to TOS, or not. I was told: they do NOT have exclusive rights to TOS! I'm sorry, if I was

misinformed - but that's all I knew at the moment. If C-Lab really has plans to develope TOS further, then everything changes. BUT: few people know about this, as nobody tells anyone anything!!

: You're right, the world isn't black and white. It's called RIGHT and WRONG.

Even Adolf Hitler thought he did the "right thing"... That's something to think about. I know _no_ living person who can say what's right, what's wrong... I only know people with different opinions. That makes an ultimate difference, I think. Some people in e.g. Vietnam have authority to say I'm "wrong" and shoot me for my opinions. But are they right? Do you know better than me? Do you?

: I wonder how many programs that you own that you actually paid for...

More than you'd believe. And think about this: how many people have courage to talk about subjects like this, without being considered as pirates and other such things? You may think I'm a "bad person" - I can't change your opinion. But let's say: for me it's important to keep Atari world alive. And I consider myself quite a honest person. In Russia, people like me used to become shot in the 60s and 70s - because they spoke out what they thought, instead of pretending something else.

Many people pretend to be angels, but act differently. I don't care what people think about my writings here - I try to do "the right thing", always. Sometimes I just don't believe in law. That's an entirely different thing. It's easy to follow rules - but it's difficult to use your brains, KNOW that something is right, or wrong...

Just yesterday I registered Towers II game for my Falcon, so even if I write unpleasant things, I do support our community. And I think, you believe it. We're in a same boat, after all.

Thanks for opinions, anyway, even if we don't entirely understand each other!

: Rich

Could someone pleas tell me what is wrong with the following
piece of code. I wrote it to solve the problem with MultiTOS
that didn't load the whole of NEWDESK.INF into memory.
What the program does is this: it just loads and puts the
NEWDESK.INF into shell memory using shel_put. Naturally
my program has to be launched after MultiTOS (or whatever)
loads Newdesk.inf into the memory (it just loads the
first 4096 bytes or so, and my INF is ~6000 bytes).
The right place to run it is from the GEM.CNF file.
Now after my program is loaded everything seems to be
fine, Desktop appears correctly with all the icons.
But the system is unstable, when I try to run some
of the programs everything just freezes. Also when
I try to change resolution the system freezes.
Please help, this is very annoying. I can't even
demonstrate Falcon's capabilities to anyone because
I'm afraid it just crashes and looks shitty.
Oh, still one thing. The problem isn't in my
INF file, because everything works fine if I just
load the Inf file manually from Desktop.
Here is my code:

```
#include <stdio.h>
```

```
#include <aes.h>
#include <osbind.h>
#include <dos.h>

void main(void)
{
     long newdesk;
     char *os;
     struct FILEINFO info;

     if (appl_init() == -1) Pterm0();

     Fsetdta(&info);

     Fsfirst("\\NEWDESK.INF", 0);
     newdesk=Fopen("\\NEWDESK.INF",0);
     if (newdesk <= 0) Pterm0();

     os=(char *)Malloc(info.size+1);
     Fread(newdesk, info.size, os);

/* this ensures that the last character is EOF */
     if (*(char *)((long)os+info.size-1) != 26) {
          *(os+info.size)=26;
          shel_put(os,info.size+1);
     }
     else shel_put(os,info.size);

     Mfree(os);
     Fclose(newdesk);

     appl_exit();
     Pterm0();
}
```

Any suggestions welcome... I'm totally puzzled... how does Desktop load the NEWDESK.INF file to memory if not like this???

Regards,
Arto Jalkanen

Good idea. Didn't think of that. I've since learnt that numbers from -1 to 1
are represented by left justified numbers.

I'll have a bit more of an experiment. If I get to know what is going on, I'll
put it on a ftp site - I sure there are other people who'll want this who don't
know too much about dsp programming - like me. 8-)

The problem is that the memory is freed and later it will
be overwritten by another program. Try it as a memory
resident program (do not Mfree) and it will work.

Yah, I figured this out right after I posted originally.

I was able to get around the limitation by changing the display address
like you suggested.
Thanks.

I need music. My screens look -- or sound, rather -- decidedly dull

without it. I could use a digital sample -- I rather like using samples when I don't need a great amount of processor time -- but my more recent routines in GFA _do_ require a significant amount of processor time (if I want to achieve a good frame rate, anyway) so it's down to chip music, which generally doesn't seem to take up much processor time at all.

I talk to a chap in the IRC who said he had some source, and then consequently failed to find it, but did mention that all Mad Max music files have the assembler player rout built into the header. Intriguing, and possibly useful as this is, I don't know assembler, and unless I know the exact locations to execute from to start/stop playing, it doesn't do me a great deal of good. (And I'm not particularily keen on trial-and-error execution, as this usually results in a great many rebootings) Would anyone have any source for this? And while I'm about it, any Mad Max music files lying around? I can rip a few -- a very few, as my sources for his music are relatively limited (oh, there's tons in demos, but try ripping them with a software ripper! Even a reset ripper will choke 'cos demos frequently trap/redirect the reset vector anyway)

Any help would be greatly appreciated; there's nothing quite so dull as a demoscreen/menu without music. You'll even get a mention in the scrolly! (This could be good or bad depending on how really awful my screen(s) end up being... so you've been warned. :-)

I think I've posted a similar article here (I'm not sure), but here it is anyway...
So, does anyone still has that ancient ASCII file called
   The Hitchhikers' guide to BIOS
If someone still has it I would be eternaly grateful to him/her if he/she would mail it to

sdzubur@phy.hr

Namely, I've had 1040STF since 1987 (or 88), but was seduced by the fals light of PC. However, I was illuminated again with the true light of Motorola 68000 processor, and I'm trying to make up what I have missed during the past 4 years that I've been using In**l processor based machines.

Thanx,
Sead

It's not an undocumented feature any more, since it was published in the Atari-Compendium (AFAIK).

If I remember correctly, let's say your MM music is at address $1000, you need to do a jump to the subroutine every vbl, ie 50 times a second. All mad max music has the player built in. First, though, the player must be initialised before the main loop starts (ie when you're setting the screen up, the palette, etc). Set d0.l to contain the number of the piece of music you wish to play, then do a 'jsr' to $1000. Now, your routine must call the actual player each vbl. This is done by a 'jsr' to $1000+6.

So, in assembler, the initialise code would be:

```
     move.l   #3,d0              ;    music 3
     jsr  music
; other code here
; vbl code
vbl
     movem.l  d0-d7/a0-a6,-(sp)  ;    save registers
     jsr  music+6            ;    play music
     movem.l  (sp)+,d0-d7/a0-a6  ;    restore registers
; other vbl code and other code here
music    incbin   "a:\mad_max.bin"   ;    music data file
```

I'm a little rusty on the addresses, but this is the general method. You might have to play around with the addresses. It might have been +8 not +6. If neither of those work then it's probably +2 (can't remember, one's for Mad Max, the other for Count Zero).
As for music files, look around the pd, there are 100s of them floating around, or rip 'em out. I seem to recall there was another address which saved the registers for you, or was that the Count Zero music driver? Shit, can't remember at the moment. I'd post an update but I'm on holiday for the next two weeks and won't be able to get to a computer.
Oh yeah, when you've finished, switch off the music by stopping the vbl (ie restoring the old one)

and then set d0.l to 0 and call 'music' again.
I may have got this hopelessly wrong, but I don't
think so. If you can get hold of a disassembler then you should
be able to work out which locations you need.
The first one is for initialisation (it's a bra instruction
I'm sure), then there are a load after it. One of the next
few is a bra which is the one you want. Can't remember at
all at the moment. A few tries should have you sorted.
Just make a little proggie that just plays music. Don't know
if you can set up an interrupt to occur every vbl easily in
gfa. There's an addreess, $456 I think, that you can bung the
music driver address into so that it'll run each vbl, but
you'll have to find out which address it is that saves the
registers as well. For Mad Max, I think one of them (+8?
saves the registers anyway for you [movem.l, then a bra, then
a movem.l to restore 'em then a bra to a location containing
an 'rts' instruciton,] so load that one into $456.
Not very good help here, but if you still haven't got it
sorted when I get back then I'll post the source (going away
on Sunday, so this is the last chance I'm gonna get to post)

[etc...]

Well, this is al very fine and well -- if I knew assembler it might even
be helpful -- but as I mentioned I don't know assembler; what I'm looking

for is a routinet to play the music in GFA. In particular, one that I _don't_ have to manually run the routine every VBL, because some of my routines take more than one VBL to execute, so there's absolutely no way I can access the player routine every VBL. If the player routine took care of its own playing (i.e. initialised and played the music itself every VBL) it'd be perfect. Ideally, what I need is something that I can just execute and leave going all by itself while I do other things, and then execute a different address to stop playing. Something, hypothetically, like this:

```
CALL code%+4       ! Initialise music
CALL code%+6       ! Start playing...
[Code here...]
CALL code%+10      ! Stop the music!
```

That, in a nutshell, is precicely what I need.

"Programmers Wanted." Isn't that just sooooo informative?
Anyway, down to business:

Bastion Products is a small startup (or upstart) programming concern for the Macintosh. [Ducking tomato] "Now wait," you may say. "What is a Mac person doing looking for programmers _here_?" What I'm doing is trying to find collaborators. We are currently working on a game. Not just any game, but a strategy board game. (All together: "Oooooh.") Trouble is, games have gotten sort of passe. Very few people buying new machines say to themselves, "Cool, I can play Lemmings." No...they got talked into buying it because it can help 'manage' their finances.

So we've got this game, and want people to want it. After a bit of

tossing ideas around, we hit upon the idea of going cross-platform with it. A friend started working on the DOS version and eventually switched over to Windows. Another associate recently started work on a version for OS/2. And I thought: Why not go _really_ cross-platform. And I looked around and discovered that there are some really nice machines that hardly anyone will admit to knowing how to program. So here I am, on groups I don't normally frequent, looking for people that enjoy programming machines that the market unfortunately did not smile upon.

How much am I willing to tell before bringing someone on? This much: The game is a strategy board game as I mentioned before. It is in your basic Go/Othello/Checkers genre. There have been other programs that follow the same basic principle but fall far short of the design that we're working on. We're looking for skilled, diverse programmers to fill some big, floppy shoes and a colorful wig. Necessary areas of knowledge include:
- Strong knowledge of UI standards for your platform
- Managing serial communications
- Any transaction-based networking that is standard on your platform
- Animation and miscellaneous graphics work
- A background in AI would be welcomed
- Attention to detail, and the ability to follow a spec

On that last one; we're not inflexible, but if you have a grievance with the spec, we'd much prefer to see it argued rationally, rather than just having divergent implementations released. The strictest points of the spec are issues relating directly to cross-platform availability. Outside of that, it largely just defines how the game works and says, "Do this, following your UI guidelines."

Distribution and profit issues are mostly hammered out, and we are willing to discuss those and other questions in e-mail.

If you're talking about GFA's EVERY/AFTER "interrupts" then no; they halt the program to execute the routine. They're useful in certain circumstances, but this is not one of them. In any event I have been sent a number of disks-worth of stuff -- music and GFA routines to play them (and they play on their own without any requirement of mine to access them every VBL; that's all taken care of) I've now got a rather large collection of chip music from various artists, and I'm quite happy with 'em... the tough part now is selecting which tunes I want to include. :-)

I assume the problem is with the display lagging behind when the user
scrolls by keeping an arrow key pressed and generating lots of repeat
keys. You can turn of key repeat by clearing bit 1 of the system variable
conterm ($484) while busy and turning it back on before re-entering the
event loop. This will effectively reduce repeat keys to those that
can be handled by the program. That's what I did in Papyrus.
In theory application programs shouldn't mess with global system variables,
but this is a real design flaw of GEM. All other solutions that I have
heard of will make macro recorders unusable by throwing away valid keypresses.

Thanks to all of you who answered my question on how to stop the keyboard key presses when the ST is busy in updating screen, disk access. I have been implementing some of the suggestions.

Thanks.

Regards
William

There were people looking for the Iomega Zip Drive FAQ v1.4 ... I have the Frequently Asked Questions and would be happy to email ti to them. I also have some questions 'saved' on the Iomega (ICD) Zip software for it. The Zip software IS available on GEnie. I will have this sortly also. Let me know who you are by emailing me.... thanks!

Hi!

I just wonder if anyone has got a working playback (or recording) routine that uses the Timer A or the MFP 17 interrupt to start when the DMA buffer has reached it's end.
What I want it for is a background DVS from disk player.
So if anyone has a routine or knows how to do it (I have tried several times but has not got it to work) please post the answer here (No Email!)

- Tomas :)

This is as designed, ^C does <C>ancel processes. Way around this is to do raw console i/o.

My guess is you use MagiC's shel_write-mode in a wrong way (that's what
happened to me at first, too):
You don't have to call
shel_write(SHW_PARALLEL, ...);
but
shel_write(1, 0/1, SHW_PARALLEL, ...);

Where 0/1 is 0 for a TOS-Programm, 1 for a GEM-Application, just as in the
normal shel_write-call.

Hope that helps...

Ciao

Thomas

IIRC:

Setup your timer a vector. Place the timer A into event count down mode (8 into fffffa19.w). Set the data register to 1 for an interrupt every event. Then to get the interrupt at the end of a sample play rather than the beging, you flip the active edge register for timer A. ($fffffa03.w). But I can't remember which you change to do this.

Subject: GEMlib pl.31
Date: 1995/06/28
Message-ID: <s4aa2b7z@qnx.com>#1/1
X-Deja-AN: 105261575
organization: QNX Software Systems
newsgroups: comp.sys.atari.programmer

I have this feeling that GEMlib patchlevel 31 (the new one) is broken.
:-(

I'm using it with gcc 2.5.8 and GEM++ 1.9. My apps worked fine with
GEMlib pl.30 (well, once I rebuilt it to not have rogue '030
instructions in it... remember the bad 2.5.x x<6 compilers we had?).

Symptoms are:

- menus are displayed above the menu bar (ie, I see about 1/2 of the
menu text)

- menus are displayed with WAY too much spacing between them... a menu
that used to fit on my high-res screen with about 1/3 - 1/4 of the
menu bar still free now _wraps_around_ the screen

- menu contents are not displayed at all; when I try to pick a menu, nothing happens, or I get two bombs

This occurs with the pre-compiled binaries, and ones I built myself.

Did GEMlib pl.31 change the way resource sizes are calculated? I couldn't see anything in the ChangeLog that would lead to this sort of screwy behaviour.

Hi,

In article <3sr06s$7bn@turing.fwi.uva.nl>, mdekker@fwi.uva.nl says...

>last week I got myself a Beehive FT10 terminal. I have this thing
>connected to my linux PC. works neat.
>Can I get it to run with MiNT on my ST? I would like to know, before
>I go through all the pains of installing MiNT....

Works. You need MiNT (newest and best version is the MH-MiNT package including
lots off patches), the init package (get that from a german site (paderborn as
I recall right) atari.archive contained an old version last time I looked and
a Minix filesystem (last version 6.11 or so)

1. Install MiNT.
2. Make a Minix partition on your harddisk.
3. Install the init package on the Minixpartition. The readme's of init should
tell you were to put everything.
4. Install in the ttytab file a getty on the right port with the right speed.
4.5. ;) You'll need a tos shell to sh, tcsh, ksh, zsh or whatever. Create in
the passwd file some accounts.
5. Hook up your terminal.
6. Reset: about at the same time your terminal and monitor should give you a

login prompt.

Notes:
It works, but it's slow (at least on a normal ST) 4Mb memory is nice.. (And I do mean nice)
Using MiNT and MiNT-net you can hook your ST up to your Linux PC, and use it as a terminal or using slip or PPP you can do lot's of other things... If only that ST wasn't that SLOW :(

Hope this is a start for you....

>but the evnt_multi(MU_KEYBD, ..) function doesn't seem to be working.
>Could someone please help me out.. Any help would be appreciated.

I tried a similar sort of thing some time ago. I think the reason it doesn't work is that key events are only received by the process which owns the top window. (Or has locked the screen with wind_update(..)). Thus inactive DA's do not get any keyboard events.

In the end, I faked it by using evnt_multi(MU_TIMER...) with a fairly long time interval, say 500ms, and then checking for the correct key to be pressed every time a timer event is received. This is hardly ideal, but it does work, and the slowdown on the system is minimal if a large enough interval is used.

OK. C compiler works fine indeed, but what about C++ compiler (i mean
libs) ? While linking I've got errors about undefined
something like: ___pure_virtual, ___builtin_new, ___builtin_delete.
Anyone have an idea?

I have to write in makefile -L$(LIBPATH), but .olb libs works fine. (
LIBPATH is ful path to library folder).

Subject: FOR SALE: Lattice C 5.6/ Programming Books
Date: 1995/06/28
Message-ID: <3sssck$t0l@enterprise.america.com>
X-Deja-AN: 105419633
summary: Lattice C 5.6 and misc programming books for sale
organization: PSS InterNet Services, InterNet in Fl 904 253 7100
keywords: lattice, for sale, atari, st, falcon
newsgroups: comp.sys.atari.programmer,comp.sys.atari.st.tech

I have been cleaning up my cleaning up my computer room and have come upon several items which I no longer need. All of the items are in excellent condition and will be useful to anyone wanting to learn how to program Atari computers, and also to those intermediate programmers looking for references.

Lattice C 5.6 - This is what I consider the finest C programming package for the Atari line. This version includes three excellent manuals covering all aspects of C programming on your Atari and also includes 'Modern Atari System Software' which has many sections pertaining to the Falcon. This set retails for $289.95.... Oregon Research sells it for $189.95... and it can be your from me for $95.00 .

The Atari Compendium - This huge book is the most comprehensive reference guide to the Atari computers. Retails for $49.95... I'm letting you have it for $38.00 .

C-Manship Complete - This is Clay Walnum's compilation of his famous programming series from Analog and ST-Log magazines. It is extremely useful to the aspiring Atari programmer. Includes disk with programs. Only $18.00 .

Atari ST Internals - A wonderful out-of-print refernce book to the Atari computers. Does not include Falcon information since it was printed long before that line. This is the third revision and includes sections on all of the integrated circuits, interfaces, and the operating system. Yours for only $27.00 .

V.D.I./A.E.S. quick reference books - This is a set of two reference books, over 200 pages in all, which summarize each V.D.I. and A.E.S. function. Extremely useful to the C and Assembly Language programmer. Both yours for $20.00 .

Compute's Technical Reference Guide to the Atari ST (Volume 1) - A wonderful guide for the budding Atari programmer...includes many examples for programming the V.D.I. This is another out-of-print book so grab it before it's gone...only $18.00 .

Learning C: Programming Graphics on the Amiga and Atari ST - Another useful book for beginning programmerrs with numerous examples for programming simple graphics routines. $15.00 .

Atari TOS Developer's Kit - This is THE item to have for all SERIOUS programmers. Includes 2 notebooks full of documentation and enough loose addendum to fill another 1 and a half notebooks. Also includes software such as the MADMAC assembler and resource construction set. Get it before it's history at only $95.00 .

**** Shipping is included for any pre-paid order inside of the continental United States. C.O.D. orders will be charged added UPS C.O.D. fee. Orders from other countries will be figured on an individual basis. Discounts may be given to those who buy multiple items.

```

A few rules you need to follow :-

1. Don't use the AES at all, it isn't initialised until all the AUTO folder prgs have finished.

2. You can use the VDI, but use a physical workstation (even if GDOS is loaded or not).

3. Everything else that I can think of should work :)

```

I'm trying to recompile the libraries (the TOS ones...) patchlevel 98, with GCC 2.3.3 for the 68030, just so they go a bit faster... after I figured out that you have to define $(MAKE) on the atari, using GNU MAKE 3.60 (I think..) it gets as far as :

make install TARGET=68030

and then four dinky little bombs appear, and I'm dropped back into gulam...

Has anyone managed to recompile these libraries, if so what did they do to get it to work...

Thanks in advance,

Neil

A keypress goes to the upper window. Using only GEM-calls it's impossible
to activate an accessory by a key.

> Any ideas how to do the same thing in Pascal?
Probably the best idea is flushing the keyboard buffer when your program
has finished its busy parts. You can achieve that by using evnt_multi:
Wait for keyboard- and timer-events (with 1ms) and loop until you only get
timer-events back, i.e. when no keyboard-event occured.

Ciao

Thomas

>

I think there is only one byte available to offset the begining of one line
from the next (counted in words). for the 3rd screen this is 3*80=240, for the
4th screen it is 4*80=320. Obviously this is too big to fit in a byte ....

I dont know of a workaround.

Tim

This one has to be implemented yet. There is someone writing a driver for the SCC-Chip which supports the fast serial lines of the TT, but there is nothing available until now (I'm desperately waiting, too - for I have a Falcon!).

>and a driver for VME graphic card (NOVA ATI 64 or other).

Maybe you have more luck with this one. You should consider subscribing the group maus.os.linux68k if you can get it, there are people who can answer your

question. I have read about people using graphic cards with linux, but I don't know if your type of card is supported yet.

Greetings,
   Thomas

>   I'm trying to recompile the libraries (the TOS ones...) patchlevel
Out of interest why are you trying to use the GNU libs? AFAICR the MiNT
libs work on TOS with almost everything except a few MiNT specific calls
and they are more actively supported now.

Does anyone know where to get info on the format of the GEM font and the font files? Would the gemlibs have something like that? Thanks.

Hmmm....unlimited horizontal scrolling...The easiest way to do this using hardware support is to first design two screens layed out side by side so you have 320 bytes per line, so in a main loop situation you would use hardware scrolling to scroll 16 fine pixels and then using the blitter you could scroll the 2 wide screen by 16 pixels, and then reset your hardware fine scrolling register back to 0, ofcourse you would still have to update the extreme left or right side, but since the incoming data dosn't have to be shifted or mask'd it should be VERY fast!! This is basically how all the consoles achieve their seemingly unlimited scrolling platform games.
Plus with this method it is VERY easy to add vertical scrolling since all your doing is adding +-320 to the screen pointers, heck you can even combine the two for diagonal scrolling!!! On STe/Falcon machines this technique should be a breeze, the only problem might be that if you don't want a FULL screen scroll happening, (score areas, etc..) I imagine you are going to have to do some horizontal blank routines to set the scan line pointers on the fly....wait a minute!! I'm giving myself an idea!!!! l8r.....

Hello,
How does one achieve those cool menu_bars_in_windows ala SpititEd ?
What about the windowsish menu extention thingies on the Lattice C editor ?
Is a set of extended GEM libs available or does one have to do all the
donkey work oneself ?
Intel *outside*,
Giles.

Hi all,

I am writing an image-converter for the PC that reads PI1 (Low res Degas)-
files and converts them, so that they can be displayed correctly on a
PC-screen. I know how the palette is stored in a PI1-file, but I haven't
managed to read the picture data-correctly. I have tried two methods of
reading the data, and the result is a one-colour picture with many vertical
stripes in it. It looks a bit like when you try to display a low-res image
on a med-res ST-screen.

If someone could tell me, or point me to information on how to correctly
read the picture-data from a PI1-file I would be very grateful.

Please don't post an answer to this newsgroup, since I am not reading
it regularly.

Thanks in advance,

```

keywords: memory allocation
newsgroups: comp.sys.atari.programmer
summary: Problems with memory allocation under C

Hi everyone,

I'm writing a program which maintains a large number of data structures via linked lists of the kind:-

```
-------------------------
Pointer to next node.
Pointer to prev node.
Static data.
Pointer to malloc'd data.
Pointer to malloc'd data.
-------------------------
```

Each node is allocated dynamically using malloc (I'm using Lattice C5.6). However, I'm leaving 32K to the operating system at the moment to ensure that there is enough memory for any system functions that dynamically allocate memory themselves (Is this necessary by the way? I've heard that the fileselector allocates memory when called, but am not too sure about these things). To request memory, I am calling (long)Malloc(-1), taking away 32K and then allocating the requested memory via malloc if there is enough space left over. The problem is this; I know that calling free does not release memory back to the OS pool, but merely marks it as free for subsequent malloc calls. However, I presume that Malloc(-1) will only return OS free memory blocks, and when I then request memory via my call, it does

not account for any memory that has been previously freed, and I will steadily 'loose' memory. I hope that kind of makes sense, please e-mail me if it does not.

Is there a way of releasing freed memory back to the OS, so that Malloc(-1) will return the true amount of memory available, or would anyone be kind enough to show me how to write memory management routines in C that will allow me to truly allocate and free memory.

Thanks for your help,

Richard.

I am writing some 3d stuff for my collage work and I decided that the OS graphics routines were not fast enough.

So, using the standard equation for drawing a line between 2 points, I wrote my own in 68000.

Guess what? Its actually slower than the OS.

Its not a long routine and I have avoided all multiplication and division

I have programmed it on my Falcon in ST Low(i.e. 4 bit planes). The Falcon runs NVDI 2.5.

Anybody any ideas/suggestions? (but please go easy, I'm only a beginer)

Here's the following for sale - US$700 o.b.o.:

* Atari 1040ST, dual drive system (one internal, one external), mouse and all necessary cabling.

* Color monitor (SC 1224).

* Spectre GCR emulator cartridge. It gives a basic Mac Plus equivalent and reads/writes to Mac formatted disks. (I'll include Mac software for word processing if interested).

* IMG Scanner (cartridge based scanner to work in conjunction with the printer).

* Yamaha PSS 680 MIDI keyboard (with cables to attach for use with Music Studio)

* Star NX-1000 dot matrix printer (with all my unused ribbon cartridges)

* I'll include my whole library of Atari ST disks (all my software collected over the years).

FINE PRINT:
It is in great condition and I'd like to sell it as a complete whole if possible. I'm in the New York City area and will consider selling outside NYC if you're willing to pay for shipping. Price is negotiable...
Please e-mail directly.

Regards,
K.K.

Why not just use the library malloc()?

>   Is there a way of releasing freed memory back to the OS, so that

Mfree(), I don't know if the Lattice free() calls this itself, it may do.

>Malloc(-1) will return the true amount of memory available, or would anyone

No, it just returns the largest block. Between when you call
Malloc(-1) and Malloc(foo), another app might have made a Malloc and
changed the largest block size.

>Falcon runs NVDI 2.5.
             ^^^^
I'd guess that you have a rather quick line drawing routine in there,
but the OS overhead is likely quite high (at least for short lines).

>Anybody any ideas/suggestions? (but please go easy, I'm only a beginer)

The most important thing to remember when you're writing a line routine
is that you always know very much about where the next point is to be
plotted. It's never more than one pixel away along the x and/or y axis.
Using that knowledge you will only need to calculate the address and

bit position for the very first pixel. The rest can be found simply by adding to the address and bit position. It's probably best to keep the bit position as a mask that you rotate.

A further optimization that can be useful when plotting lines that have a horizontal major axis (that is the axis you move along for every point) is to delay writing to memory as long as possible. When you're not changing y-coordinate up to 16 pixels can be written to memory at a time.

If you've done those things and it's still slow, you should take a look at the algorithm you use for following the line. The two most common ways to do that are called the DDA and Bresenham algorithms and there are almost always threads on those in comp.graphics.algorithms.
The DDA is easy to understand (it's likely that you use something similar) while Bresenham looks a bit strange. Using the mid-point approach it's quite simple to derive an algorithm that is equivalent to Bresenham, though.

By the way, the mid-point method is very useful for deriving algorithms for drawing many kinds of curves, for example circles and y=x^2. It does not seem to be very well known for some reason, but I can describe it if you're interested.

LedPanel is the best one. It is an AUTO prg, which works in any
resolution except True Color (it is fully Screen Blaster compatible).
It has a clock, a caps on indicator, and drive access indicators.

You can find it on atari.archive.umich.edu and mirrors.

There's also CLOGGE.ACC, which has a clock and memory indicator
(no caps on indicator).

I don't know where you can find it (try a.a.u.e or ftp.cnam.fr).

I solve my problem. I have to link file op_vnew.c (from GCC2.6.1 archive)
with gnu.olb. But now there appears another one. I cannot debug C++ code
with gdb 3.6 pl 4 (however pure C code works well). It gives error :
unknown symbol table at pos 16. Is that means that I'll not be able to

debug g++ 2.6.3 code anymore ??? :((

PLEASE __**H E L P**__ !!!!!

Simon.

newsgroups: comp.sys.atari.programmer,LINUX.DEV.680X0

I compiled succesfuly 1.2.10pl1 version of kernel and I found few problems while running it on my F030/4Mb/68882/ide Quantum 130MB/SCSI Quantum Empire 1080S. The most significant problem is that sometimes the kernel hags up my SCSI drive and sometimes (but rarely) it has problems with IDE HD (aspecially when there is no disk in FDD ??). It also gives message HD write status: xxxx (I don't remember) 0x50.

so... any suggestions?

regards,

Simon.

This won't work. Remember: With GEM, Keyboard-Input is sent to the
application that owns the topmost window, or, if there's no active topmost
window, the application with the active menu-bar. Since Accessories don't
have a menu-bar, you can only get keyboard-input by having a window open
and at the top, or by reserving the keyboard for you with
wind_update(BEG_MCTRL). Using BEG_MCTRL from within an accessory regularly
or permanently is no good idea, though, since other apps won't get any
keypresses during this time. So it's better to use a timer-event and check
for a special combination of the shift-keys (maybe Caps-LShift-RShift).
If you really want to use a key, you'll have to write an auto-folder program
that hooks into the keyboard-vektor and sets a special flag the acc can
read when the right key-combination has been pressed.

Ciao

Thomas

Have you got one of the POOLFIX autos installed? This will correct any
probs. with memory not being freed. I think POOLFX94 is the recommended one.

Ok, many months ago I located this in Czechoslovakia (the server is now down). It is TOS 4.92. It works beautifully in single=tasking mode, but when I install MiNT it crashes on any high rez screen mode (except LOW). The MiNT I use is FreeMiNT 1.12.4. I was wondering, is this a bug that needed to be fixed in this unreleased TOS? All I really want is the AES from this TOS, and would be openned to ideas of extracting just it.

I don't have any suggestions for you; however, I am experiencing identical problems. This may stem from the fact that 1.2.10pl1 is based on 0.9.6 (correct me if I'm wrong). My previous version (0.9.7) was _very_ stable, and had no such problems.
My setup is quite similar: F030/4 w/ '882, 84MB IDE conner and 420MB SCSI quantum.

atari.archive (and mirrors): Mint/Lib/mnt(olb|inc)44.zoo

(pl46 should be around somewhere too)

They provide direct support for the extra calls in Mint and MagiC!3,
as well as working with long filenames, UNIX-style paths (/), signals,
etc etc.

It seems like many programming teams are working on things more or less like a DOOM clone. But I wonder why nobody has had the following idea yet:

WHY NOT MAKE A REAL DOOM CLONE?

I mean, make a program that can read the WAD files that describe the virtual worlds of DOOM. You could use the original WAD files of DOOM, as well as the hundreds of WADs that one can find on the net.
Such a program would ensure us of having new worlds by the load, whenever we want them.
Even funnier: PC programmers would develop games for us without even knowing it!!!
You wouldn't even be obliged to have textures on the walls. It would even be a way to reduce considerably the space WADs would take in memory or on the disk: a simple program could get the WAD rid of the textures.
A DOOM clone on atari, even without teures, would be great, don't you think?
I'm launching this idea, because it seems good to me. But I know nothing about the structure of WAD files, and don't have time to develop this project.
But I hope someone will!

Bye.
Bertrand

If you use malloc, it depends on the implementation. In 99% of the
cases I'd say no. BUT: it is very unlikely, that you really want
to give the memory back to the system if you are using 'malloc'
anyway.

What kind of application are you writing anyway ? This is very important,
in this case.

Nat!

too bad, no atari is powerful enough to handle doom (just look at substation).

:Even funnier: PC programmers would develop games for us without even knowing
:it!!!

doom is not a PC game.
besides, pc programmers don't care about programming for other platforms,
unlike atarians.

:You wouldn't even be obliged to have textures on the walls. It would even be a

:But I hope someone will!

my guess is, it won't happen: atari hardware is not powerful enough.

Try allocating the block of memory once and reallocating it yourself. I think
that malloc will not release the memory back to the system - that would slow
the routine a fair bit.

I hope someone can give a better method; your own memory handeling routines
tend to be a bit of a pain.

Tim

Are you kidding? Seems like you've never programmed a falcon...
FYI, there are many demos on the falcon doing texturing on walls. Nothing as
complex as DOOM, but if you take away the textures, and only have to draw
polygons (except for the monsters, of course), you get rid of the most time
consuming part of the program. There are many programs that manage virtual
universes without textures on atari. And even very old ones. There was this
very old Psygnosis program, something 2 (starglider?) that was quite complex.
And it ran on a plain ST. The DSP and 68030 can do a lot better, and I'm
absolutely sure that a non-textured DOOM is possible. At least on the falcon.
btw, I think substation is a very little thing. Nice, that's all. imo.

>doom is not a PC game.
Ah? I have a PC here, and doom runs on it. There are other versions, of
course, but what do you mean?

>besides, pc programmers don't care about programming for other platforms,

Hey George!

Anyway, it is much faster than AES 4.0. It doesn't bog down the system
as MultiTOS did. MiNT with AES 4.1 is head over heals faster.

Rich

I believe he meant that Doom wasn't developed on a PC. The original
game was done on NextStep, and I believe the WAD files are still created
there. So initially Doom wasn't a PC game.

Of course I don't mean that. Why are people on newsgroups so condescendant and
so aggressive each time someone proposes something? To prove they are more
intelligent?
Anyway. The whole point is just to benefit from the enormous number of WADs

that already exist.

>Do YOU want to eat up hard drive space with WAD files that meet or exceed
>a meg a piece? Another consideration is that the graphics in the
>original Doom are stored uncompressed and in such a fashion as to achieve

Come on! Everybody has a large hard drive nowadays. They are so cheap. Anyway, if you get rid of the textures, you get rid of the largest part of the files.

>any other machines for that matter -- because the PC is inherently a
>sloppy architecture with software to match. I'd rather someone made a
>Doom-Like game with their own equivalent to a WAD editor so people can
>make their own worlds...
Why not? Go ahead. How many people use falcons? How many use PCs? That's why in my opinion, it's a good idea to use preexistant files.

>So you'd have to convert them, first...
Yes. So what?

>Doom - Texture Mapping = Substation.
Come on! Either you've never played Substation, or you've never played DOOM. These games have nothing in common. Substation is at most a Wolf3D clone.

The question is what makes DOOM so fun?
The answer is not the textures. Otherwise, it would be as much fun to watch the demo.
No. What makes DOOM fun is
1) The speed
2) The first person action
3) The paranoia (the sound is very important for this, and the falcon is good at it)
4) The speed
5) The speed

Well, anyway, I gave this idea in the hope that some people would find it good and make something out of it. But if everybody thinks it's crap, well, OK. Too bad.

By the way, I would be interested to know what people do with their ataris?
Why on an atari? If you program, what do you program and for whom?
This is just out of curiosity. I know perfectly well why I own a falcon, but I was just wondering about all of you.

Bye.

Seem's to be a problem with MiNT. 1.12h2 works ok (at least, with AES4.1, which is more recent than 'TOS4.92').

Craig.

I am not being aggressive; I was merely stating a point.

: Anyway. The whole point is just to benefit from the enormous number of WADs
: that already exist.

Perhaps. But this also means that the Doom clone would require the walls
to be arbitrarily angled, as opposed to orthogonal, which takes more
processor power to do. Textured, this probably wouldn't be possible with
a decent frame rate on the Falcon. Gouraud shaded, and possibly
lightsourced/depth-cued, perhaps.

: if you get rid of the textures, you get rid of the largest part of the files.

Not everybody has a hard driive these days. A good many do, but I'd say
that the majority of ST users do not. (Though the majority of Falcon
users do) There's also the question of how _much_ hard drive space they
have. I have 250 megs, most of which is full, save for about 3-4 megs.

: Why not? Go ahead. How many people use falcons? How many use PCs? That's why
: in my opinion, it's a good idea to use preexistant files.

Someone would still have to make a WAD editor for the Falcon, otherwise
people are stuck using what others have made, not being able to make
their own. Furthermore, such WADs would not be compatible with the PC
version.

: Come on! Either you've never played Substation, or you've never played DOOM.
: These games have nothing in common. Substation is at most a Wolf3D clone.

I've played both. Okay, perhaps Substation is more a Wolf 3D clone...
but the biggest reason for this is the orthogonal walls. My point,
however, is that without the texture mapping, it's not much of a Doom

clone. The textures added to the ambience of the game, the reality of
it, they were what made the game, for the most part, so innovative.

: The question is what makes DOOM so fun?
: The answer is not the textures. Otherwise, it would be as much fun to watch
: the demo.
: No. What makes DOOM fun is
: 1) The speed
: 2) The first person action
: 3) The paranoia (the sound is very important for this, and the falcon is good
: at it)
: 4) The speed
: 5) The speed

: Well, anyway, I gave this idea in the hope that some people would find it good
: and make something out of it. But if everybody thinks it's crap, well, OK. Too
: bad.

: By the way, I would be interested to know what people do with their ataris?
: Why on an atari? If you program, what do you program and for whom?
: This is just out of curiosity. I know perfectly well why I own a falcon, but I
: was just wondering about all of you.

: Bye.

Bertrand Le Roy (bleroy@ccr.jussieu.fr) wrote:
: It seems like many programming teams are working on things more or less like a
: DOOM clone. But I wonder why nobody has had the following idea yet:

: WHY NOT MAKE A REAL DOOM CLONE?
^^^^^^^^^^^^^^^^

If you mean, make a REAL port of Doom, called Doom, authorised by ID Software, then you're talking about a major licensing fee here, which couldn't possible be justified in potential sales of the game.

: I mean, make a program that can read the WAD files that describe the virtual
: worlds of DOOM. You could use the original WAD files of DOOM, as well as the
: hundreds of WADs that one can find on the net.
: Such a program would ensure us of having new worlds by the load, whenever we
: want them.

Do YOU want to eat up hard drive space with WAD files that meet or exceed a meg a piece? Another consideration is that the graphics in the original Doom are stored uncompressed and in such a fashion as to achieve the maximum speed on a PC. Such measures are not needed on Ataris -- or any other machines for that matter -- because the PC is inherently a sloppy architecture with software to match. I'd rather someone made a Doom-Like game with their own equivalent to a WAD editor so people can make their own worlds...

: Even funnier: PC programmers would develop games for us without even knowing
: it!!!
: You wouldn't even be obliged to have textures on the walls. It would even be a
: way to reduce considerably the space WADs would take in memory or on the disk:
: a simple program could get the WAD rid of the textures.

So you'd have to convert them, first...

: A DOOM clone on atari, even without teures, would be great, don't you think?

Doom - Texture Mapping = Substation.

: I'm launching this idea, because it seems good to me. But I know nothing about
: the structure of WAD files, and don't have time to develop this project.
: But I hope someone will!

: Bye.

Hello, world!

Does anybody have a good public domain/shareware/freeware C++ or pascal compiler for my ATARI 1040 STe?

Help would be appreciated.

Regards,
        Bert Greevenbosch

I am having some problems with mouse double clicks on tos 1.4. Double clicks don't register by event multi call.

I remembered that someone did a posting of code fragement on how to solve this, or it was in one of the ftp site. Unfortunately, I failed to locate it again and so if anyone have this or knows anything on this subject, please let me know. Thanks.

Yes, that's right. And not only that, but also windows, parts of walls, stairs, and so on. In fact, Doom is built with horizontal ceilings and floors and vertical walls of arbitrary size but rectangular (even if the textures are transparent in some places). Descent does texture mapping on polygons of arbitrary size, shape and orientation. So we would have to manage a filled polygon world. Towers 2 does texture mapping at a reasonable frame rate because once more, it's more like Wolf3D than like DOOM: vertical, orthogonal walls.

>Textured, this probably wouldn't be possible with

>lightsourced/depth-cued, perhaps.
The demo of Boom does some texture mapping on non-orthogonal walls, but not of arbitrary size. I agree with you all in saying that a Doom textured clone is almost impossible with a reasonable frame rate. And of course, when you move fast, smoothness is essential.

>Not everybody has a hard driive these days. A good many do, but I'd say

You're right, but anyway, it wouldn't be reasonable to release such a game on a diskette. And once more, the textures take the largest amount of disk space.

>Someone would still have to make a WAD editor for the Falcon, otherwise
>people are stuck using what others have made, not being able to make

I'm not sure. Of course, it would be better to have an editor. But among Doom players, how many do their own WADs? It would be nice in the first place to play the existing files.

>I've played both. Okay, perhaps Substation is more a Wolf 3D clone...

It's an opinion. It's true that textures are part of the realism of the game. But in my opinion, the interest lies in the speed and the paranoia. The textures add something but are not essential. In fact, Ultima Underworld featured texture mapping before Doom, but it didn't have its success.

So it seems like nobody is seriously tempted by the idea? Too bad.

Bye.

The common prob. in 1.4 is a single click in the scroll bar being interpreted as two clicks (text flashes past!). Is this what you mean? It is cred by a number of ACCs - I use SCROLFIX.

Bertrand Le Roy (bleroy@ccr.jussieu.fr) wrote:
: OK We always miss the nuances on internet.

True; it si difficult to convey proper meanings over the Internet without
the element of emotion involved.

: Yes, that's right. And not only that, but also windows, parts of walls,
: stairs, and so on. In fact, Doom is built with horizontal ceilings and floors
: and vertical walls of arbitrary size but rectangular (even if the textures are

: arbitrary size, shape and orientation. So we would have to manage a filled
: polygon world. Towers 2 does texture mapping at a reasonable frame rate
: because once more, it's more like Wolf3D than like DOOM: vertical, orthogonal
: walls.

Actually, Doom is not as processor intensive as Descent because Descent
is 6DOF; textures have to be scaled on all 6 axis (taking into account
left/right/up/down rotation) whereas Doom only requires 3 (Forward/back,
up/down, left/right) DId Doom have arbitrarily angled ceilings? I can't
remember; I thought they were all pretty much flat, rather than angled.
Additionally, windows do not take up much processor time; those are just
masked sprite; it's the same as if you just had no wall there at all,
except it's a smaller area of a wall that's been cut away. Stairs
similarily are just raised walls, in a way.

: The demo of Boom does some texture mapping on non-orthogonal walls, but not of
: arbitrary size. I agree with you all in saying that a Doom textured clone is
: almost impossible with a reasonable frame rate. And of course, when you move
: fast, smoothness is essential.

True enough.

: You're right, but anyway, it wouldn't be reasonable to release such a game on
: a diskette. And once more, the textures take the largest amount of disk space.

True here, too.

: I'm not sure. Of course, it would be better to have an editor. But among Doom
: players, how many do their own WADs? It would be nice in the first place to
: play the existing files.

I'd say that considering the number of WADs that are available, quite a
few do their own WADs. Heck, there's an entire CD full of WADs, and
that's likely not all of them.

: It's an opinion. It's true that textures are part of the realism of the
: game. But in my opinion, the interest lies in the speed and the paranoia. The
: textures add something but are not essential. In fact, Ultima Underworld
: featured texture mapping before Doom, but it didn't have its success.

Ultima Underworld was nice, but it was after Wolf 3D, and not a great
deal different (save that it was in a Fantasy genre) so probably didn't

illicit such a response. Plus, Ultima Underworld, like all of the Ultima games, was an adventure/RPG, made for the thinking man, while Doom is just an all-out, sheer blast-a-thon with a few puzzles interspersed in between for the sake of variety (and not very challenging ones, either). Ultima Underworld featured its moments of panic, but not one right after another, and in such profusion or length as Doom. Plus, both were very atmospheric in their textures; I think that is what helps to _add_ to the paranoia of the situation. The more realistic it seems to the player, the more they can envision themselves -in- that world, and the more they can become involved in it phsically. For example, can anyone picture themselves as Sonic when they play that game? I can't. This, also, is the major appeal to Alien vs. Predator on the Jag: It's got solid, even scary atmosphere that grabs the player by the scruff and scares the hell out of them.

: So it seems like nobody is seriously tempted by the idea? Too bad.

I'd love to do it if I knew how... and I'd love to see such a game. But the reality is that sacrifices would have to be made in order to achieve a good frame rate. And those sacrifices will detract from the realism of the game.
  Mind you, there /are/ tricks to get around that. For example, if you were merely using gouraud shading and light sourcing, it would be easy to make the game set in a Sci-Fi realm where the walls are made of solid steel; this could explain the plain, grey nature of the walls. Spot textures could easily be added to the walls without taking up too much processor time, enhancing the illusion of reality.

I succesfuly configured gcc 2.6.3, so I can compile and link C and C++ programs properly. Thats great. But I was be able to debug C++ programs compiled with gcc 2.5.8 under gdb 3.6 pl 4. And now I can debug only C programs. While I try to debug C++ (compiled with 2.6.3) I've got a message:

Reading in symbols for test.cc... invalid member type dataformat, at symtab pos 16.

Does it mean that I WILL NOT be able to debug any C++ (compiled with 2.6.3)???? I would like to use new C++ feauters like exceptions available at 2.6.3 (and with some bugs removed). I have many good ideas to write good C++ programs... Maybe someone have any idea.

*** ANY HELP WILL BE APPRECIATED ***

It would be very unusual if it did. Most DSP applications work on a 16
bit fixed point format. Assuming it runs in Q13, which is highly
likely, and means you divide up your 16 bit input words such that
there are 13 bits after the binary point:

```
 Data-in(x) = INT(16384.0*f(x))
 F(x)       = FLOAT(Data-out(x))/16384.0

 Dynamic range = +1.999939 -> +6e-5
                 -2 -> -6e-5
```

...if you really want to work in floating point. I never do - keeping
all your values in the corrent integer format in much faster, and
probably more accurate that to keep converting float->int->float.

```
>    S,EEEEEEEE,MMMMMMMMMMMMMMMMMMMMMMM
```

>That's the bitpattern for single precision IEEE floating point,
>(commaseparated for clarity).
>
>S is the sign bit (1 == minus),E is the exponent 2^(-127 to 128) and M is
>the mantissa normally taken to be a number between one and two (1.MMMMM...),
>except when E is 00000000 == 2^(-127) when M is interpreted as (0.MMMMM...).

Also the exponent is stored in a base relative form, ie the real
exponent is something like 2^(-128+E). All zeros or all ones in the
exponant indicated an out of band value (infinity, zero, Nan or a
denormal number depending on the other fields).

Mr Craig P Drummond (ee11cd@surrey.ac.uk) wrote:

: In some of these windows I've implemented PROG_DEF objects (such as radio
: buttons), and I use my own VDI workstation.
: The problem is that if I select a PROG_DEF object in a background window,
: when GEM redraws the object (as SELECTED or DESELCTED) it overwrites onto
: the top of any overlapping window.
: For my windowed dialogues I'm using a modified version of FLDLIB - however
: I haven't changed the redraw function.

The problem is in the AES form_button call, which is used by FLDLIB to
handle mouse clicks. It performs no clipping (it was not designed with
windowed dialogue systems in mind) and hence you will observe this effect
with any selectable object - try it with a large radio button, for
example. You've obviously removed the top window check I put into FLDLIB
in order to prevent this effect in your modified version.

There is no way around this problem bar writing a replacement
form_button, which I didn't want to do for compatibility's sake.

I need some ideas for line drawing routines:

Ok, I've written a version of the bresnham line drawing alogorithim, and it works fine. After getting it to work, I tweaked to run entirly form dregs. Then I played some more and made it even faster.

But. even with the optomisations it ain't fast enough. I should be able to draw about 12 lines a frame, and with a bit more tweaking i think i can get about 18 320 pixel long lines. This isn't very much really, so I need to find some way of precalculating every possible line.

Also I want to extend the line drawing routine into a polygon drawing routine, so if the line drawing routine is slow the polygon drawing routine, will be unbearable.

The general idea for polygon routines, is (I think) to simply draw horizontal lines between the side points calculated, but i was thinking of doing something like filling in squares of the ploygon, until it's filled. This would be quit efficent I think until, you get down to small polygons when it would be better to use a fill in by lines routine.

So does anyone out there want to donate ideas for graphics routines. Please post rather than email, as this info is probably of interest to others.

Help!

I am trying to write a GFA program to call another program (a TTP actually) from within MagiC.

I have tried every combination of shell_write as detailed in the MagiC programmers guide with no success.

Can anybody help!!

Thanks in advance.

From: ppospis@mtroyal.ab.ca
Subject: GCC 2.33/2.58 problem
Date: 1995/06/15
Message-ID: <1995Jun15.163044.4968@mtroyal.ab.ca>#1/1
X-Deja-AN: 104452046
organization: Mount Royal College, Calgary, Alberta
newsgroups: comp.sys.atari.programmer,comp.sys.atari.st

I have grabbed gcc binaries for both 2.33 and 2.58. I am using a 1040ST, 4Mb and gulam. I think that all the appropriate environment variables are all set, i.e.

```
setenv GCCEXEC = i:\gcc\bin\gcc-
setenv GCCINC = i:\gcc\cinclude
setenv GCCLIB = i:\gcc\lib
setenv GXXINC = i:\gcc\include
```

plus all of the aliases and environment variables for each ttp. And the gcc/bin directory is on my PATH. Each of the directories from the environment variables contain the appropriate files.

The typical Hello world program in C compiles perfect. However, the same program in C++ will not. For both version the following is generated:

```
In file included from i:\gcc\include\g_congif.h:16
          from i:\gcc\include\streambu.h:25
          from i:\gcc\include\iostream.h:24
          from t.cc:1:
i:\gcc\cinclude\stdio.h:155: warning: `_NFILE' redefined
i:\gcc\include\compiler.h:212: warning: this is the location of the previous
definition

m:/cc1000001.o: Undefined symbol _cout referenced from text
m:/cc1000001.o: Undefined symbol ostream::operator<<(const char *) referenced
from text
```

Does anybody have any idea what the first chunk means?

The two warnings while annoying I can live with.
However, why do they occur?

The two undefined symbol errors would seem to indicate that the linker is not finding the g++.olb, but it is in the lib directory. I have tried adding a GXXLIB environment variable with the same result. Does gcc 2.xx expect different environment variables for g++?

I am using the g++ libraries and includes version 20 and gcc libraries and includes version 98.

Any ideas or suggestions on how to fix these would be greatly appreciated. Thanks

I am writting a GEM small editor. I would like to disable keyboard input to my application while it is busy updating screen/disk access etc. The problem is I don't want it to toatally disable the keyboard so much that background programs are stopped. Anyone have any ideas or code fragment (C / assembler) on how to do this?

I think the general idea, is to read the keyboard rapidly after IO until
no characters are available, thus emptying the keyboard buffer. Don't know
from experience thou' cos I've never done it.

Try an evnt_multi loop on a short timer and keypresses. As soon as you get a
timer event then exit the loop. Although I've never used this, IIRC all of
the key press events should be emptied from the buffer first.

I am trying to write a frequency meter (for relatively low frequency measurements) and have been trying to get a timer of reasonable accuracy. I tried to use a bios call from gfa (which says it measures milliseconds to 20ms accuracy) but the number I get back is always 20. Where else can I get a clock of about this speed ? Is there a convenient memory location I can read ? Is there something that runs faster (1MHz ?)

Good luck, as I even tried bypassing GfA's SHEL_WRITE() command and made
the call via the AES myself and it still didn't work. That is the only
thing I can't get working right for both MultiTOS and MagiC. I gave up
on it.

If you find out how, then I would be most interested in your solution myself!

I've got a program -- a conversion program for ZX Spectrum snapshot formats -- that's generally a DOS program for the PC, though it has a Unix makefile as well. I'd like to compile this on the ST as a .TTP program (and maybe program a front-end for it) but unfortunately I know nothing of C, much less C compilers. Would anyone be willing to compile the C source on an ST? It's rather small and easily UUEncoded/transmitted, and it is also available on my Speccy WWW page (URL in my .sig). If anyone would be willing to do this please E-Mail me. Thanks!

Keywords:

I want to use both left and right mouse buttons, with event_multi (with also keyboard, messages). Is there a
simple way to do this? I thought of:

```
retour = evnt_multi(MU_BUTTON|MU_TIMER,1,1,...,0);
retour2 = evnt_multi(MU_BUTTON|MU_TIMER,2,1,...,0);
```

Because, when i use evnt_multi(MU_BUTTON,LEFT|RIGHT,...) it only exits when BOTH left and right buttons are used
- and that's not what i want!

(Sorry if its'nt the exact syntax, i'm not on my Falcon now)

Thank's for answers (please with a copy on e-mail, i can't read news every day...)

Can anybody give me a hint where I can find a
description of the view-protocol defined by Peter Seitz?

Thanx, Jens

The actual value IS garbage, EXCEPT when compared with values
in the other bins.

Try passing it an addition of two different sines. If they are far enough
apart, you will get two values (and some "bleed" into neigbours if the
frequency doesn't fall exactly into a FFT bin). The relative values of the
two bins will have the same relationship as the relative signal strengths
of the two sines. The actual value depends, among other things, on the length
of the FFT.

Hi,
  Could anyone tell me if there are any ST programming-related FTP
sites around? I'm particularly looking for info regarding programming
the STE's blitter, and demo source code, that kind of thing.
  Thanks very much,

- Andy

: regards,

: Simon.
Hi

I've tryed that 2.6.3, and with the -O4 -m68020 -m68881 and the 020
libraries it is fine. In fact it seems that it runs three times faster
(I've tried comparing POV with PURE C and GCC). You should find good
libraries on ftp.uni-muenster.de on /pub/Micros/atari/Gnustuff where
the good gnu.olb is the PatchLevel 97 and the good gem.olb is the
PatchLevel 31.

But I've got a Pb. It seems impossible to link with this version of
GCC. For linking I use in place, an old version of GCC that takes the
.olb libraries instead of .a. If someone knows how to link with this
2.6.3 version, I would be glad to be replied.
Another thing, this version works very well under tos but would probably
need virtual memory for big programs. Bye for now ...

I downloaded the ls-IR.gz file & it has Gcc 2.6.3 listed in the directory
" Linux-68k/ELF/gcc-2.6.3.bin.tar.gz".

Does this mean that it only works under Linux68k (Falcon & TT)?

Yes. In GFA code to time something would look something like this:
t%=TIMER
@cool_routine_but_i_dont_know_how_fast_it_is
PRINT (TIMER-t%)/200

That would give you the time in seconds.

Tim

I am attempting to utilize hardware scrolling for horizontal movement on an STe. Everything works fine if I try to scroll across two, three, or four low rez screens. But if I try to set up more than four screens to scroll across then the screens do not display properly. I am setting up the display in memory by interleving the screens in the same manner no matter how many screens I'm working with: one line (80 words) of screen 1 followed by one line of screen 2 etc continuing through one line of the last screen, followed by the next line of screen 1, etc through 200 lines.

Does anyone have any idea of what's going wrong?

I appreciate any help.

shel_write(...SHW_PARALLEL...) seems to work OK from C, so perhaps GFA basic
is not leaving enough memory free to launch another program. Try using
LIMITMEM on GFA before running it.

$466.w is updated every vbl, ie 50 times a second, and thus provides
timings to 0.02s accuracy, ie 20ms accuracy. Need to be in supervisor
to access it though (gemdos #32 is the supervisor/user mode toggle:

```
     clr.l    -(sp)
     move.w   #32,-(sp)
     trap #1
     addq.l   #6,sp         ;    into supervisor
     move.l   d0,old_ssp    ;    save stack for later
; your code goes here
     move.l   old_ssp,-(sp) ;    restore user and old stack
     move.w   #32,-(sp)
     trap #1
     addq.l   #6,sp
     clr.w    -(sp)         ;    exit
```

trap #1

I've never coded in gfa so I don't know how you'd do this. I guess the basic plan is to switch to supervisor, saving the stack, bung in a new stack if you need it (probably gfa'll take care of this) do your code and when you quit your proggie, remember to restore the old user state.
Come to think of it, gfa'll probably let you access protected memory anyway. If it bombs out on you, you need to be in supervisor mode (attempts to access protected memory in user causes a crash).

There are other ways, but this seems the easiest. Not sure about the accuracy of measurements though in a basic...

There's another memory location that holds the 200Hz timer tick, but I can't remember what this is. Get back to you on that one.

Hope this helps

To flush the KB buffer, check to see if there are any keys waiting, and if so get the key from the buffer, and loop until there are no more keys to get. Don't understand though why you should need to since screen updates, disk access, etc. will be doing their thing and the keys will simply go into the buffer. Of course, you probably have a newer ST than me (hey, one which does more than one program at once!) - I've got a 520STFM so don't need to worry about multi-tasking (well, programme switching really, not genuine multi-tasking of course), and unless the keys are acted on under interrupt so that you can access the disk, update the screen etc at the same time then I don't see why there should be a problem. Hmmm, is it just me? Am I being exceptionally stupid and missing something blindingly obvious? Sorry, not coded for many months, last I was doing some little demo code, and a database, etc.

My poly-rout uses the bresenham-line algo and only works with convex-polygons:
'Draw' lines arround the polygon, but do not set any points, just store in an array the left and right most point.
After doin' that, go down from the first y-pos to the last and draw horizontal lines from the left to the right most x in the array.

The advantage is that only horizontal lines must be drawn and clipping is easy.
But the bresenham could very good optimized (even in 6502-code, where I wrote the routs).

You have to change the port-bit in the PSG (think it's port B) to change from output to input. In GFA, the IRQs should be forbidden.
In assembler you can get transfer-rate up to 512K/s (on a 36MHz-F030).

Hi Griff and everyone else trying thier brains out! You may now put them right back where they belong!

I (we) has now succeeded in making a working DMA to DSP and vice versa using handshake mode. The routine only works with 16 bit and 24 bit mode right now but I'll see if I could get it to work in 8 and 12 bit mode as well. Sources to a DSP testprogram and to a 68030 program to control it is included at the end of this article.

The SSI in the DSP is set to an Asyncronous, Gated clock mode. The frame sync is set to a Word Length bit clock on both transmit and recieve. Both transmit and reciever clock are external.
The frame syncs are set to parallell mode in the Port C Control register (PCC). This means that you will have to start and stop the frame syncs your self both when transmitting from and when recieving to the DSP. This is done by setting and clearing bit number 5 and 4 respectively in the Port C Data register (PCD).

It is very important that the DMA buffers are on even adresses because the system will clear the LSB in the adress and the result will not be what you expected!

Good luck to all of you and if someone would get 8 and 12 bit mode to work before me please post the solution here!

- Tomas :)

Hi there,

I am writting a simple GEM text editor for one of my applications. Currently the editor can block whole complete lines easily. I would like to be able to do blocking of partial lines.

Does anyone have any ideas on how to do this? I have pondered on this for several weeks now but still haven't come up with something useful.

Regards
William

My latest theory is to write a machine code routine to sit in an inline to carry out the Shell_Write.

I would be grateful if someone would UUcode me a linkable C file that can be compiled with the GFA source code.

You can't have more than four screens wide. Why? 'cos the overlenght line register is one (1) byte wide, and tells the vid chip how many words to skip after completeing the current line. 160 bytes + 254*2 = 668 bytes of screen which is roughly equal to 4 screens. If you want to do infinte scrolling in the horizontal direction, you need to be a bit more clever.

Assuming you're scrolling from right to left (ie new background comes on on the right hand side of the screen aka double dragon).

make two screens: (v = current horizontal offset)

```
v

now move the horzontal screen pointer

```
uv                      x
+----------------------+-----------------------+
|:                     |:                      |
|:                     |:                      |
|:  drawn on           |:    blank             |
|:                     |:                      |
|:                     |:                      |
|:                     |:                      |
|:                     |:                      |
|:                     |:                      |
+----------------------+-----------------------+
y                       x
```

now we need to update the bit at x (cos it's just scrolled on screen)
BUT we also draw exactly what we draw at x at y.

When the horizontal offset reaches the second + (ie when we've scrolled a hole page) then reset the horizontal pointer back to the start. Now heres the clever bit. Because we've been drawing on the 1st page as well as the 2nd page, now page 1 holds an exact copy of whats on the 2 page, so we can reset the pointer back to the start, and repeat the process.

We've can now scroll the screen left for as long as we like, with out running out of memory.

This trick also works with vertical scrolling, and can easerly be adapted to scroll either left or right.

[----------Disclaimer----------]
What I'm about to describe, is what i've though about. But I ain't done it so don't blame me if you waste hours of your time trying to implement it only to find it don't work. Also it's 7:40 am and I haven't been to bed yet, I'm tied (go figger) In fact any and all what I've writen here could be complete cobblers.
[----------Disclaimer----------]

If you want to scroll both left and right then you need 3 screens. Start of in the middle then scroll in either direction, not forgeting to draw the new screen data not only where it's coming into view but also going out of view. If my thinking correct then it doesn't when you change scroll directions, as long you only reset the screen pointer when reaching either the left most edge or the right most edge.

: shel_write(...SHW_PARALLEL...) seems to work OK from C, so perhaps GFA basic
: is not leaving enough memory free to launch another program. Try using
: LIMITMEM on GFA before running it.

It does not work. Heck, even making GfA give up memory via RESERVE or
compiling with a memory limit still does not work. Limitmem was one of
my ideas at one time, but no luck.

My only idea would be to write a C routine and link it with the GfA
code. Perhaps that would work. Perhaps GfA is masking off the upper
bits of the SHEL_WRITE() call and only allowing 0 and 1 for values. Hmm...

:   Thank's for answers (please with a copy on e-mail,
i can't read news every day...)
:   Emmanuel CURIS
:   curis@clipper.ens.fr

try the following:

return = evnt_multi (MU_BUTTON|MU_TIMER, 0x102, MO_LEFT|M_RIGHT,0, ...);

Tis uses an undocumented feature of AES: If you set bit #8 in the parameter for clicks (maximum number of mouseclick), the condition for mask (mask of used mousebutton) is inverted.

In my example it meams:
 wait for button or timer (MU_BUTTON|MU_TIMER)
 maximum count of mouse clicks is two and invert mask (0x102)
 left _and_ right button (MO_LEFT|MO_RIGHT)
 wait for relaese these buttons (0)

it will wait for:
NOT (RIGHT and LEFT) released
 =
(RIGHT pressed) or (LEFT pressed)

Martin

Can anyone here help me with uncompressing a GIF LZW data.
I have been able to extract the 9bits (to 12bits) of data
from the codestream, but I can't do a decompression.

Any sourcecode (in pascal would be even better) is appreciated.
In fact, anything at all to do with the above problem is appreicated.

Regards,
Nima

Does this mean that all future versions of GCC greater than 2.6.3 will
only work under Linux?

Has the development of TOS/MiNT versions stopped?

Hi *

for my GEM-programm i want to use offscreen bitmaps.
The only problem i have: How to do it???

I'm still using TurboC, so i need a "pure" C-Code (no lib).

Thanks for your help in advance.

Martin

Hi all!

I found one problem with Grunenberg's EnhancedGEM library version 2.20 (though it may be in earlier versions as well).
The bug is exposed when writing accessories to run on older TOS versions (e.g. 1.04). You need to call open_rsc() or init_gem() functions, that will do a menu_register() call for you. The problem is, that this AES call is wrapped within wind_update() calls. This causes the problem. You can easily uncomment this call in source (dial.c) and recompile the library. It works fine then.

Bye Borek

NVDI has offscreen bitmap support from v.25 on. The offscreen bitmap part
of NVDI is also available as a separate program, called "Enhancer". You
can find this on most FTP sites as ENHANCER.LZH. Source code examples in
C are included, IIRC. Hope this helps...

For some reason, Heat-And-Serve C did not include the dirent structure in the
file "dir.h". Since I'm coming from the Amiga, I don't know if this structure
is in use on the ST or not. Anyway if anybody has this structure please email
it to me ASAP -- it's holding back one of my programs.

>I`m still trying to hook my Mega keyboard to my Falcon...

IIRC the signals on the Mega and Falcon keyboard connectors include:

Mega
pin
15V
25V
3TXD
4RXD
5gnd
6gnd

Falcon
pin
1gnd
45V
5TXD
6RXD
7reset
8gnd

Let me know how you get on.

I have been playing around with the features of the later AES versions (like background operation, auto-shutdown etc.) but cannot get the Res-change mode of Shel_write to do anything useful.

Using Shel_write(5,...) I have got it to change resolution upon exit. But what

use is this? I want a dynamic change of resolution... So I tried
Shel_write(1..)
to launch the program again, after it had exited. However it launched it before
the resolution had changed...

Sooo.... Is it possible to do anything useful with this call?

Anthony

newsgroups: comp.sys.atari.programmer

Dear Falcon owners,

I have a Falcon Speed AT emulator for sale:

It has a 16 MHz 80286 CPU with a Norton factor up to 12 and
includes EGA/Vgamonochrome graphics emulation.
It runs Windows at 256 colors with a special driver (all included)
and reaches a quite satifactory speed in doing so!

It just plugs into the direct processor expansion slot of the Falcon -
all you have to do is remove a jumper blocking one of the rows of pins.
You can make one partition DOS bootable and the TOS partitions are fully
accessible for DOS too.

I used the emulator to port stuff written in PureC to TurboC, testing it
on the run and the same machine... Now however, I got a separate Pentium,
so I really don't need the Falcon Speed anymore...

I paid about DM 400.-- a couple of months ago (Deutsch Marks that is) -
offers are welcome; just drop me a mail.

Regards,

Christian Goltz

I'm still learning to program in C and I use Sozobon C sometimes. It works fine on my Falcon and hasn't been unstable so far. IIRC ST-Guide and PacShell (both programs by Holger Weets) are written with Sozobon C. Also, there's a version of Peter Hellinger's MagicLib for it, so it seems that Sozobon C fulfills most requirements of a normal C compiler. I kind of like it because it generates quite short programs.

In a previous article, richcsst@crash.cts.com (Richard John Kelsch) wrote:

As for GfA, I only know of a USA distributor of GfA. They are called
"Toad Computers" [...]

While the good folks at Toad are certainly a good place in the USA to
begin a search for _anything_ to do with the Atari, they are not the
sole USA distributor of GFA products.

That distinction belongs to:

PTR Precision tech. Inc.
Phone 203-741-2281
Fax 203-745-7932

But AFAIK, they have no GFA products for the Atari, as all support
for the Atari platform has been dropped by GFA Systemtechnik.

If you don't want to learn C and don't want to deal with GFA's lack of
support, you might try HiSoft Basic C which includes support for MultiTOS,
SpeedoGDOS and the Falcon. The US distributor is Oregon Research
(503-620-4919 or orres@teleport.com) which is currently offering a
competitive upgrade offer from GFA or any other BASIC. They have a nice,
new catalog out so contact them directly for more info.

I've got Sozobon X and I think it is excellent. Earlier versions of the
Xdlibs library were a bit buggy but it seems to be okay now, although some
of the MiNT-lib type functions haven't yet been fully implemented.

I would say it is fast; you can pre-compile header files too, so that helps.

I've tried compiling a number of packages I've found around the 'net, and it seems to work quite well for the majority of them. I'd really like a DRI-linkable version of EGEM, though, and it just happens to be one of the libraries I couldn't get to compile with Sozobon X. However, that may be because I tried to compile it with the Xdlibs rather than the MiNTlibs (the different header files may have caused the problems).

I would recommend it. Also, it's probably one of the only C compilers for the Atari range that is continuously in development, with the exception of GNU C, which I personally dislike due to the fact it's absolutely huge (poor me, only 1 Meg :-( ).

As for Gemfast running under MTOS, I don't know.

Since you're in Scotland, you should buy from:
    GFA DATA MEDIA (UK) LTD
    Unit 4 Bentley Industrial Center, Bentley
    Farnham, Surrey, GU10 5NJ
    ENGLAND

Tel: 01420 22707
Fax: 01420 22807

Compiler costs: GBP 30 + 1 p&p
Do specify v3.5 or v3.6 as appropriate to your interpreter.

'Tis true that no development has been done past v3.5(ST)/v3.6(TT), so that there are no ready-to-use one-line calls appropriate for Falcon. With AES4 documentation to hand however, these calls can be managed by writing your own functions which hide the dirty details of system calls with op-numbers. Compiled code, if properly written, will run fine on any platform. For editing in anything except stock ST hi-rez, use the 3.6 interpreter which can handle TT resolutions.

There are also some German library patches which will "fix" a few things, such as removing Line-A calls.

Hi!

Has anyone tried, or perhaps has a working routine, on how to transfer data from the DMA-buffer to the DSP using handshake??

The other way DSP->DMA I have got working but I don't know if it is the best way of doing it.

After have read the DSP user's manual and Atari developer manual several times and ours of trying in front of the screen, I have more or less given up.

I guess I will have to use Asynchronous mode with Gated clocks in the DSP but I don't know if I will have to use On-Demand

(Network) mode or if it works with Normal mode. The routine I have that sends from DSP to DMA uses Normal, Synchronous (doesn't matter when only transmitting I guess), and a Gated clock. That one uses the 25.175 MHz clock but maybe it should rather use the 32 MHz.

My routine works something like this: (I don't remember exactly)

```
; Turn on frame sync:
     bset #5,x:<<PCD

; Wait for transmit shift register to be empty:
w_TDE    jclr #6,x:<<SSISR,w_TDE

; Move data to transmit register:
     movep x0,x:<<TX

; Turn off frame sync:
     bclr #5,x:<<PCD
```

While experimenting with On-Demand mode I didn't have to start and stop the frame sync but the data being transferred is not correct.

If someone know how to do this or has tried but not succeded please let me know and maybe we'll come up with something!

Don't Email me!!! Post answers in this group!!

Grateful for any help!

Does anyone know of a C editor that has the "Turbo C" look, where lines are automatically indented, code is grayed out when a closing bracket is not found, etc? I'd really like one, and don't feel much like making it (although I'm about at that point in my search!).

Try :

http://www.cs.man.ac.uk/~jacquesa/samplay_c.html

for some source code for playing a sample. To do 8-bit mono, 12.5 Khz, you
would want the values RES=2, VALUE=1 and SCALE=0.

To detect whether the sample has finished, you can use SndStatus (?) to test
the position of the pointer in the sample.

To record (Remember that its 16-bit stereo only), change MODE in Setbuffer
to 1 in stead of 0.

To find out where the buffer is currently recording, and also to detect when
the buffer has run out, check the rec_ptr from SndStatus (?) I dont have the
details on me, so I cannot be specific I'm afraid...

Hope this helps

well I have a atari ST, 1meg. I don't do too much with it anymore but
I would love to play with OMEn. any pointers as top where to get the
latest OMEn version, C compiler for it etc?

No. The *AES* isn't loaded until the AUTO folder has finished. The VDI
however *is* active, and you have to v_opnwk() the appropriate screen
driver (Getrez() + 2) at the start of your program and v_clswk() at
the end.

:>Hi!
:>Has anyone tried, or perhaps has a working routine, on how to
:>transfer data from the DMA-buffer to the DSP using handshake??
:>
:>The other way DSP->DMA I have got working but I don't know if
:>it is the best way of doing it.

I wrote a routine to transfer a bitmap via the SDMA to the DSP and back again using the DMA - this was acheived by connecting the DSP OUT -> DMA Record and DMA PLAYBACK -> DSP IN. Four track 16bit stereo was selected to give the maximum possible transfer rate (20kb/vbl at 50hz). The routine worked.*However* I couldn't find a way of 'synchronising' the transfer at startup - this mean't that the first few words of a bitmap could be lost (a seemingly random number of words in fact).

:>After have read the DSP user's manual and Atari developer
:>manual several times and ours of trying in front of the screen,
:>I have more or less given up.

I spent quite a few hours scratching my head too!

:>I guess I will have to use Asynchronous mode with Gated clocks
:>in the DSP but I don't know if I will have to use On-Demand
:>(Network) mode or if it works with Normal mode. The routine I
:>have that sends from DSP to DMA uses Normal, Synchronous
:>(doesn't matter when only transmitting I guess), and a Gated
:>clock. That one uses the 25.175 MHz clock but maybe it should

:>rather use the 32 MHz.

I was using a 32mhz clock, and using SSI interrupts to transfer the data
for both transmitting and receiving, I didn't try polling, I tried a lot
of different transmit/receive modes,most of which didn't seem to have any
 affect at all. I think the final mode I settled for was On-demand network
mode or something, I can dig out the routine if any is interested.

:>My routine works something like this: (I don't remember exactly)
:>
:>; Turn on frame sync:
:> bset #5,x:<<PCD
:>
:>; Wait for transmit shift register to be empty:
:>w_TDE jclr #6,x:<<SSISR,w_TDE
:>
:>; Move data to transmit register:
:> movep x0,x:<<TX
:>
:>; Turn off frame sync:
:> bclr #5,x:<<PCD
:>While experimenting with On-Demand mode I didn't have to
:>start and stop the frame sync but the data being transferred
:>is not correct.
:>If someone know how to do this or has tried but not succeded
:>please let me know and maybe we'll come up with something!
:>
:>Grateful for any help!

I have a 520STFM (512k) and I also have a 60MHz Pentium PC, I would like
to code for the ST as this computer is nice and easy to learn.....(unlike
the PC!) , is there any way I can compile C source code on my PC for
download onto the ST?? If there are any CrossCompilers or CrossAssemblers
out there then please email me or post reply here.

Thanx,

Edith Pro is reasonable in these respects. It doesn't grey code
out, but gives you a warning bell when you type a closing bracket
without a matching opening bracket (is that what you mean)?

Help, I wrote a "hello world" program using Sobozon C 2x, on my Atari 1040ST
and it keeps bombing. I am sure it has something to do with GEM. The
compiler gives me a ".out" file that I renamed to both ".prg" and ".tos".
Both of these files bomb upon running, however it is only after it does
print to the screen. So the program works, but not after. And all I get
is bombs when I run the programs within Neodesk 4. I have to even run
without Neoload loaded. All I get is a screen dump of information.

Any ideas?

Does anyone know how to setup the enviroment for Sobozon C? the directions
I got with it are really sparce.

thanks in advance

Dale

using the oukami shell to compile my little c programms with the SozobonX
i had following problems:

after having compiled a definately correct c-source, my programm
bombed me with 2 or 3 bombs in file
access routines (as far as i could make out). do i reset my ST
(or as i recently tried) load the ram with a big program, quit it and
run my prg again it'll work fine ...

i also discovered after 8 hours of desperated search and hacking an asm
ram monitor, that a with malloc() reserved bit of the ram was just over
written by c-variables used by my programm after the malloc()
(this also seem to cause the bombs)
maybe i'm a victim of my 'unclean' programming or might there be a bug
in the sozobonX ?

i tried to mail one of the maintainers already(as mentionen in the Sozobon
docs) but got no reply yet.

If you open a workstation then you can use VDI commands to find out how
big the screen is (height and width in pixels) how many bit planes there
are etc.

You can also use VDI drawing routines.

Isn't it AES that isn't active at this point? I'm not entirely sure how
much of the system is awake, all I've ever done is get screen sizes and
used draw routines (I've only tried lines) and v_gtext.

This routine seems to use continous mode and NOT handshaked.
 I think I too have a version of this somewhere but it's not what I want.

It's all academic for me. I am not the one desiring to create a mouse
environment program for the AUTO folder. The other gentleman is.

Rich

What language are you working in? Both STOS and GFA have good built in
tools like BLOCK transfer, put/get, etc, that can easily allow you to
write some sprite routines. STOS even has built in sprite handling.

STOS has some pretty neat extensions to allow you to do just about anything as far as game design goes. If ineed you just want to TOY around, then I would suggest STOS as good starting point. On the Falcon you should go ahead buy a reference book like the compendium or Modem Software Programming (from HISOFT?) they both will give you a good idea of the OS calls. Game wise there is very little in print to help you out. Sorry.....

The VDI mouse handling routines also work, here's two functions I use

```
void vq_interface(short *mb_state,short *x,short *y,char *key,char
*scan,long *m od,char release)
{
        *key=-1;
        *mod=0;
        do {
```

```
                vq_mouse(handle, mb_state, x, y);
                if(iskbhit()) v_get_key(key,scan,mod);
        } while(!(*mb_state & 3) && *key==-1);
        v_waitmouse(release);
}

void v_get_key(char *key,char *scan,long *mod)
{
long x;

        Supexec(conset);
        x=Bconin(2);
        *key=x & 0xff;
        *scan=(x>>16) & 0xff;
        *mod=Kbshift(-1);
        Supexec(conunset);
}

long conset(void)
{
        oconterm=*(char *)0x484;
        *(char *)0x484 |= 1<<3;

        return 0;
}

long conunset(void)
{
        *(char *)0x484=oconterm;

        return 0;
}
```

The first function loops until a mouse button or the keyboard is pressed. The second is called by the first to handle the keyboard - I forget why I did it this way and stopped using getch() (or whatever it was). It works and is reliable on my Falcon, whether running from AUTO or the Desktop.

Use v_hide_c and v_show_c are used rather than v_dspcur and v_rmcur.

This is needed for the initialisation of the VDI after you have set up the physical workstation (or virtual if you run the prg from the Desktop).

```
    vsin_mode(handle,1,2);     // Set sample mode for mouse
```

Hi there,

I'd like to write a veeery simple (believe me, veeery simple...) text editor in gfa-basic, but I do not have a clue about how to do it, I know how to read and display text but not on how to edit it on screen in large blocks.....

Any help will be VERY appreciated.....

Thanks a lot.

Savino

I have been downloading files using ncftp through Uniterm and cannot work out the uses of putting the files into usable form. I've been having problems with all types of files (.zip, .arc, .lzh), to unzip, "unarc" and "unlzh". Can anyone tell me how to do it?

Also, I managed to "unzip" the .zip files but only got a "TOS #35" error message when trying to load them up.

Can someone tell me where I'm going wrong and what commands I should use to solve this problem.

Thank you in anticipation.

Dear Anyone,

Here is a question for you... why the hell does the following piece of HiSoft Basic 2.10 code bring up a Bad Channel Number error on line 6 when I compile and run it? I'm using an Atari Falcon030 with TOS 4.02 and I can't for the life of me see what on earth is wrong here. God I hate HiSoft Basic, why I spent a hundred quid on it I'll never know :-(

OK, so this isn't quite the right place to ask, but I've asked on comp.dsp and seem to get very complicated answers that I don't quite understand.

Anyway....

Anyone have any idea on the output format of the data from the standard DSP FFT routines. I mean like IEEE floating point format etc.

I managed to get data to it, like passing a sine wave and only one result is set, but the actual value seems to be garbage.

Can anyone help ?

Thanks,
Phil.

Hi,

I have a problem using WF_BEVENT and my PROG_DEF objects.

I've set my windowed dialogues to respond to background object selection
(i.e. objects can be selected without topping the window) by using
wind_set() with the WF_BEVENT parameter.

In some of these windows I've implemented PROG_DEF objects (such as radio
buttons), and I use my own VDI workstation.

The problem is that if I select a PROG_DEF object in a background window,
when GEM redraws the object (as SELECTED or DESELCTED) it overwrites onto
the top of any overlapping window.

In my PROG_DEF handler I do set the VDI clipping rectangle. Everything
worked perfectly until I added background object selection.

If I use my window library's equivalent of objc_draw() to redraw the objects
then everything id OK - no overwritting occurs. This only happens when the
object changes state & GEM initiates the redraw!

For my windowed dialogues I'm using a modified version of FLDLIB - however
I haven't changed the redraw function.

If you know how to resolve this, please contact me via email at

ee11cd@surrey.ac.uk

Thanks!!!!!

Craig.

(p.s. I'm using LatticeC 5.60, on a TOS 4.04 Falcon)

newsgroups: comp.sys.atari.programmer

I am trying to compile EnhancedGEM 2.20 with Pure C 1.0, but I am
running into a problem: the linker complains that _aes is undefined.
Now, _aes is supposed to be a symbol defined by Pure C (it is
declared as `extern long _aes' or something like that; the calls to
it are of the form _aes(0, 0xlongaddress)). I know that the problem
is caused by the fact that I need Pure 1.1 to compile the library,
but I don't feel like paying a lot of money for an upgrade just to
be able to compile this one library. Could anybody help me out as
to how _aes shd be defined?

Thanks in advance,

I'm unsure of your excact method for downloading, but this may help:

1: When you use ftp , use the command "bin" to tell the server that you
want to download the file as binary.

2: If you use kermit , use the command "set file type binary" and remember
to click the binary box in uniterm as well.

I was unaware that the 56k could output in IEEE format but here we go:

S,EEEEEEEE,MMMMMMMMMMMMMMMMMMMMMMM

That's the bitpattern for single precision IEEE floating point,
(commaseparated for clarity).

S is the sign bit (1 == minus),E is the exponent 2^(-127 to 128) and M is
the mantissa normally taken to be a number between one and two (1.MMMMM...),
except when E is 00000000 == 2^(-127) when M is interpreted as (0.MMMMM...).

: definitely _much_ faster and more efficient than the GEM equivalent.
: I don't think that emulating the GEM calls would be that inefficient
: under X Window. I suspect the result would be faster in performance than
: a GEM program running under MultiTOS.

Well, I don't want to start another OS war, but in my view it is
simply unfair to compare Linux and MultiTOS, since Linux is an amateur
project that is simply bound to be more efficient than the commercial
MultiTOS (if this sounds somewhat contradictory to you, compare IBMs
SNA with TCP/IP -- you will see what I mean). And I heavily doubt that
your 486DX50 can do X on top of <some commercial PC-Unix> (even with
lots of RAM) quite as fast as a TT can do MagiC (ok, NVDI won't hurt
either) -- to turn things round for a change.

At least the workstations I have worked with (including various
RS-6000-Boxes, NeXT-Machines with Motorola and HP-Hardware, Sparcs),
while outperforming the TT by a factor of 10 at the very least, simply
didn't feel as snappy und X as my TT under MagiC (though they could
live scroll, which is a major problem for the TT). A few years ago
there was a saying like there is no machine that's fast enough for X.
Those were the days when Workstations had 68030 or their relatives
working in them...

I admit, having X on a machine is nice. Having X for networked stuff and
GEM for local stuff where snappy response counts is much better.
However, emulating GEM calls on X doesn't seem to good an idea to me:
You lose the flexibilty and elegance of X and sacrifice the speed of GEM.

 S> this, if so, where.

Probably a combination of the two. I have a good book which covers
disassembly techniques in some detail - 68000 Assembly Language -
Techniques for Building Programs by Donald Krantz & James Stanley
(Addison-Wesley).

The 68K instruction set is very regular & uses the upper 4 bits of the
operation word as an opcode which groups similar instuctions together.

Hope this helps.

: Does anybody know if a version of Word Perfect was ever released for
: the Atari.

"The Atari" is a broad term. It could mean:

The Atari 400/800/XL/XE line
The Atari ST/STe/TT/Falcon030 line
The Atari 2600
The Atari 5200
The Atari 7800
The Atari Lynx
The Atari Jaguar
The Atari Portfolio
The Atari ABC PC line

If you mean the Atari ST line, then yes. Word Perfect 4.1 was
released.

:: definitely _much_ faster and more efficient than the GEM equivalent.
:: I don't think that emulating the GEM calls would be that inefficient
:: under X Window. I suspect the result would be faster in performance than
:: a GEM program running under MultiTOS.
:
:Well, I don't want to start another OS war, but in my view it is
:simply unfair to compare Linux and MultiTOS, since Linux is an amateur
:project that is simply bound to be more efficient than the commercial
:MultiTOS (if this sounds somewhat contradictory to you, compare IBMs
:SNA with TCP/IP -- you will see what I mean). And I heavily doubt that
:your 486DX50 can do X on top of <some commercial PC-Unix> (even with
:*lots* of RAM) quite as fast as a TT can do MagiC (ok, NVDI won't hurt
:either) -- to turn things round for a change.
:
:At least the workstations I have worked with (including various
:RS-6000-Boxes, NeXT-Machines with Motorola and HP-Hardware, Sparcs),
:while outperforming the TT by a factor of 10 at the very least, simply
:didn't feel as snappy und X as my TT under MagiC (though they could
:live scroll, which is a major problem for the TT). A few years ago
:there was a saying like there is no machine that's fast enough for X.
:Those were the days when Workstations had 68030 or their relatives
:working in them...

I work with a sun 5 with 32Mb ram running Solaris 2.4.
I am sure no Atari running any
OS can beat this machine, and believe me, I know atari machines quite
well!

:
:I admit, having X on a machine is nice. Having X for networked stuff and
:GEM for local stuff where snappy response counts is much better.
:However, emulating GEM calls on X doesn't seem to good an idea to me:
:You lose the flexibilty and elegance of X and sacrifice the speed of GEM.

let wait and see Edith 4X first ok?

: Well I have a question or two. I am new to the newsgroup but not new to
: GFA programming, and I was wondering whether there is now a reliable way
: of removing both the top and bottom borders?

Not in GFA. Overscanning is a very time critical procedure, and GFA is not
nearly fast enough to handle it. Only assembler can do this.

: Also anyone who can remove the side borders ----in GFA---- please help.
: Anyone who can remove a single line or multiple lines of side borders
: would be interesting reading. It would be nice to write a Hardware
: scrolling routine in GFA that does not gobble up memory as much. One
: pixel hardware scrolling is easy but takes up more than a 1/2 meg machine
: has to give.

By hardware scrolling, do you mean STE hardware scrolling? Or some other
method? My scrolly rout runs fairly well, depending on the size of the
font, but I wouldn't call it a hardware scroll... it's just your bog
standard scrolline routine.

: Chaz.

I'd get hold of a copy of 'Papyrus' instead, for Wp 4.1. is somewhat
outdated and Tempus Word pro is not available in an English version.

There was one but it didn't last long as the producers were not willing to support such a (comparatively) small user base.

Your best bet for getting one is from junk stands at Computer Markets or second hand through BBS ads.

Hmm. I have both systems on my TT. There is not a lot between them - though NVDI helps MTOS whereas neither MiNT-X nor Linux/68 benefit from it.

Single TOS is faster than X though.

OTOH though its not MTOS (even the better AES 4.1 version) that MiXT is going to be compared to. Its going to be compared with the likes of MagiC. MagiC is much more optimised for Ataris than X11 ever will be.

I still think MiXT is a good idea though. My PC is (486sx2-50) runs X11R6 very nicely - and it would be nice to recompile GEM programs for it.

:-)

I was given Laser C (version 2.0) original disks and manuals. However
when I try to run it, I am informed that it does not work with TOS 1.06
(I have an STe w/TOS 1.062) and that I should run the "Patch.prg" Well,
well ,well :^) I can not find a "Patch.prg" anywhere on my four
disks!(the three disks plus the upgrade to version 2.0 disk) Does anyone
have a clue as to what is going on here?
Thanks for any help.
thanks.merci
-ken

well, it seems that no one uses or has used Laser C.
So I would like to find out what C language is preferred for programming on
the Atari. MarkWilliams? Lattice? ...?
thanks.merci

I thought that Juergen meant X-AES (from the Let'em fly comment...). If so, I believe that there is a source release at Hensa I believe....

I could be wrong though.

See ya,

Anthony

Does anybody out there know if there is a utility that will convert pictures in .NEO or .PI1 format into something more "useful" for the PC, say .GIF format?

I want to put screenshots of my games onto my homepage, and this is the only way I can think of... pointers to ftp-able sites would be useful.

Thanks,

Ozzy.

Hi,

I'm a final year degree student and I'm writing a D2D package for the Atari Falcon. So far I've managed to implement the record & playback sections (I'm writing the editing part at the moment), however I have a few queries:

1. When I 'm playing/recording a sound file I display a model dialogue box to prevent the user from accessing any other part of the system. The reason for this is that during simultaneous playback/record, the timing is very critical - therefore I cannot allow the user to perform any other actions. I display the dialogue using the normal calls, except I use evnt_multi() and not form_do() for user input. The reason for this is that I want to stop playback/record whenever ANY key or mouse button is pressed (anywhere). Unfortunatley if another program's window is open (such as XControl) when this dialogue is displayed and the mouse is clicked on top of the open window, then that window is topped, and my program doesn't receive the event. How do I prevent this - i.e. how can I display a system modal dialoguebox that waits for multiple events?

2. Also, how can I detect if either mouse button (or both) is pressed using evnt_multi() - If I use the value 3 for the mouse parameter it still doesn't work.

3. How do I implement cycling of windows (i.e. using the CTRL-W keyboard short cut)? How do I know which window is the one that should be topped?

4. This isn't a programming question, as I've finished the record/playback section (apart from the niggles above) - I was thinking of uploading it to an FTP site so that I could get feedback from potential users (this would look good in my final report). How do I go about this - I've never actually uploaded anything - however I do have full internet access. Secondly, which FTP sites would be the best to upload it to?

Please send any replies to : ee11cd@surrey.ac.uk
- or - Craig.Drummond@ee.surrey.ac.uk

Thanks for any assistance.

Craig.

p.s. When I've finished the whole project I may upload the thing (executable, C-Source code, and -maybe- my actual report) - is anyone interested in this?

Really? Please give details. I am not 100% clear about the addressing modes, but I've never
had any major problems. The only bug I've found is that you can't have too many labels starting with
the same character/s (probably some hashing algorithm bug).

I also think that DevpacDSP is good because it produce binary output and is quite fast.

Alan.

Well try GEM-View it is the best for graphic viewing at least and can cope
with loading and saving in many different formats (Mac, Sun, PC etc..)
it is avilable on ur server ;) src.doc.ic.ac.uk..
in something like /pub/packages/atari/umich/Graphics

If we are talking for the Atari, then what about Gemview? I think that
this has .GIF and degas support...

I expect it can be ftp'd from hensa, or any of the other major sites (I would be
more specific, if the server with netscape on it's HD wasn't down...)

No longer being developed. If you disregard the multitude of excellent extensions available. No longer supported. If you don't consider the STOS mailing list, the STOS disk magazines and the STOS articles published in STF to be support. It has more support than just about any other programming language for the Atari. Probably because its nice and easy to use so it gained followers quickly.

Could somebody post me the EXACT format that NeoChrome screens come in?
Thanks muchly...

I _think_ that it's 32000 bytes of screen data stored in the standard
Atari screen format (i.e. ghastly) followed by 32 bytes of palette
data. But what is the other stuff for?

What I want to know, is this:

- Where the palette data starts
- What format the palette is stored in
- Where the picture data starts
- What format that is in

PLEASE e-mail me ASAP with the info - thanks!

Ozzy.

It seems that Lattice C & Pure (Turbo) C are the most popular packages. Test
has shown that Lattice produces the faster code, but compilation time goes
square with length of file (keep your modules small and healthy). Lattice
comes with assembler and resource-editor + debugger. You can even do some

inline machinecode programming. It's supposed to conform to ANSI standards allthough a lot of stuff that I have tried to compile just spits out errors Consider this:

```
     unsigned int some_func(some_type){

          /* do something*/

          return -1; /* Lattice won't accept this */
          }
```

Well, I interprete that returnvalue as max int ? On the other hand, the stuff I have written at home compiles straight out of the box on other systems!

I had an "evaluation copy" of Turbo C 1.5 a long time ago, but I'm sure that somebody else can inform you better about the bells and whistles of Pure C.

Don't forget to consider Gnu C as well. A lot of Mint stuff & Unix ports can only be compiled with that one. Understands C++ as well. And is *free*.

Hi Phill,

There is in fact a version released (once on a 'fair' introduced, must be a long time ago because I bought my first mem expansion (512 Kb for plenty cash). I thought it was 4.1. (not wysiwyg, that's why it was not accepted [that's write was better and wysiwyg]. I don't know where to get it, but I will look around, okay?

I am writting a small GEM program that uses multi_event calls to get users keyboard/mouse inputs. The problem is keyboard inputs are buffered while my program is busy updating screen etc. This is actually good but it goes on to clear the keyboard queue even after the user have stopped inputing. This cause nasty effects when the user is deleting lines and the program continues deleting lines even when the user stopped pressing the delete key.

How can I control the keyboard queue? Any ideas are welcome.

>disks!(the three disks plus the upgrade to version 2.0 disk) Does anyone
>have a clue as to what is going on here?

Well, I've not got Laser C, but if I remember correclty it's a wee bit old these days, so programs compiled with it may have problems if you use the original libraries and someone tries to run it on a TOS 2.00 or greater machine. I'm not sure about this, but there have been one or two programs which run fine under TOS 1.6, 1.62 but not under TOS 4.04, and the only problem has been the libraries used by the compiler. Imagine trying to patch the code, just the compiled in libraries part with a more up to date set of compiled libraries, by hand, without a symbol table or owt like that... it's a bit tiresome.
Still, your best bet I suppose is to try some atari ftp sites..

>well, it seems that no one uses or has used Laser C.
>So I would like to find out what C language is preferred for programming on
>the Atari. MarkWilliams? Lattice? ...?

Well, I've got Lattice V5.6 and thats good, but my C compiler of choice is definitely GCC 2.3.3 - simply because so many unix programs can be made to compile on your ST with next to no fuss....

Hope this helps,

Neil
(nab@comp.lancs.ac.uk)

p.s. wasn't Laser C called something else originally, or did it become something else... wasn't Megaroids written in it ?

Mr Craig P Drummond (ee11cd@surrey.ac.uk) wrote:
: Hi,

: I'm a final year degree student and I'm writing a D2D package for the Atari
: Falcon. So far I've managed to implement the record & playback sections (I'm
: writing the editing part at the moment), however I have a few queries:

: 1. When I 'm playing/recording a sound file I display a model dialogue
: box to prevent the user from accessing any other part of the system.
: The reason for this is that during simultaneous playback/record, the
: timing is very critical - therefore I cannot allow the user to perform
: any other actions. I display the dialogue using the normal calls,
: except I use evnt_multi() and not form_do() for user input. The reason
: for this is that I want to stop playback/record whenever ANY key or
: mouse button is pressed (anywhere). Unfortunatley if another program's
: window is open (such as XControl) when this dialogue is displayed and the
: mouse is clicked on top of the open window, then that window is topped,
: and my program doesn't receive the event. How do I prevent this - i.e.
: how can I display a system modal dialoguebox that waits for multiple
: events?

Lock the screen semaphore. It makes it so other processes do not receive
messages until you release the semaphore. The command is
"wind_update(x)" x being 1 or 0.

: 2. Also, how can I detect if either mouse button (or both) is pressed using
: evnt_multi() - If I use the value 3 for the mouse parameter it still
: doesn't work.

Got me, I've tried the same thing. I have "Mickey Moused" and waited for
a mouse event with evnt_multi() and then checked the status of the mouse
buttons after evnt_multi() returns.

: 3. How do I implement cycling of windows (i.e. using the CTRL-W keyboard
: short cut)? How do I know which window is the one that should be

:   topped?

I suppose the quickest way to do this is to make the top-most window the bottom one. However, this only works with AES versions over 4.0. The command uses "wind_set" with the mode parameter being decimal 25.

:   4. This isn't a programming question, as I've finished the record/playback
:   section (apart from the niggles above) - I was thinking of uploading it
:   to an FTP site so that I could get feedback from potential users (this
:   would look good in my final report). How do I go about this - I've never
:   actually uploaded anything - however I do have full internet access.
:   Secondly, which FTP sites would be the best to upload it to?

Upload it to the University of Michigan (umich) in the USA, hensa and demon in the UK, any spot in Germany, and ftp.cnam.fr in France.

: Please send any replies to : ee11cd@surrey.ac.uk
:   - or - Craig.Drummond@ee.surrey.ac.uk

: Thanks for any assistance.

: Craig.

: p.s. When I've finished the whole project I may upload the thing (executable,
: C-Source code, and -maybe- my actual report) - is anyone interested in this?

Sure, we are always interested in new projects.

Rich

I have recently written a new program which I intend to release in the near future.. unforuntately I have come up with a in my humble opinion a serious problem..

The problem is if I run the program without SpeedoGDOS it crashes... I have found that the problem comes with the init_gem call..

I tried to compile the minidemo C program in one of the provided demo programs, and the Program would only run if SpeedoGDOS was installed..

Any help regarding this matter would be greatfully received,

Alex Nicholls

Mr Craig P Drummond (ee11cd@surrey.ac.uk) wrote:

: and my program doesn't receive the event. How do I prevent this - i.e.
: how can I display a system modal dialoguebox that waits for multiple
: events?

Using wind_update(BEG_UPDATE) prevents events from going to any other application than your own. Then use evnt_multi to sit on mouse and key click events. I suggest that you do not attempt process GEM message events during this period (apart from possibly AP_TERM etc.). Free the system using the normal wind_update(BEG_UPDATE) call.

The reimplementation of form_do given in the LC5.6 manual uses this method.

: 2. Also, how can I detect if either mouse button (or both) is pressed using
: evnt_multi() - If I use the value 3 for the mouse parameter it still
: doesn't work.

I used to know how to do this, but I've forgotten and lost the original message - so I'd also be happy if someone reposted the solution.

: 3. How do I implement cycling of windows (i.e. using the CTRL-W keyboard
: short cut)? How do I know which window is the one that should be
: topped?

I take it you mean including windows owned by other applications? Under any AES 4.0-compatible or above system, there are wind_get modes which allow you to find windows at a given position. On single tasking systems (and possibly under Magic) IIRC there are at least 2 protocols allowing

window cycling to extend to accessaries and other applications. If you
need more info on this, email me and I'll dig it out.

:   4. This isn't a programming question, as I've finished the record/playback
:   section (apart from the niggles above) - I was thinking of uploading it
:   to an FTP site so that I could get feedback from potential users (this
:   would look good in my final report). How do I go about this - I've never
:   actually uploaded anything - however I do have full internet access.
:   Secondly, which FTP sites would be the best to upload it to?

For .ac.uk, the easiest site to upload to is micros.hensa.ac.uk. Use
'put <localfile>' in your ftp program to place the archive and a small
message in /incoming/atari/falcon (IIRC). atari.archive.umich.edu is
rather hard to get on to so that you can upload, but you can mail files
to the archive administrators, and it's widely mirrored around the world.

: p.s. When I've finished the whole project I may upload the thing (executable,
: C-Source code, and -maybe- my actual report) - is anyone interested in this?

Yup, I'd be interested.

ATB,

Martin

After returning from whatever your program was busy doing, it should take care of all char's in the buffer. Throw them away?? Or if you want typeahead but not "delete-ahead", then put_to_screen while not backspace or delete detected, throw_away the rest. (If only emacs would understand that, sigh..)

I have Lattice C 5.6 for Sale, $175.00

It's just out of the Box.
I'll include "THE ATARI COMPENDIUM".

Never have time to learn it for the Falcon.

Add 256 to the mouse state requested, eg wait for 259. It's documented
in the errata for the Atari Compendium. This trick has always worked for
all TOSes, as far as I am aware.

I am currently writing a program in which I want all forms to have so-called flydials (a sort of `folded' upper right corner) that can be used to move the entire form. The stupid thing is that I've been able to figure out how to implement this, but for the sake of uniform appearance I would like them to look the same way they do in e.g. Gemini or Interface. Looking at the resource files of those programs revealed that the flydials are simply transparent `crossed' boxes of which only the lower left diagonal part is drawn (this sounds a bit strange but if you've seen them you'll know what I mean). The question is: how can one draw only that part of an object rather than the whole object? Or am I missing something and are they achieved in a different way? Any help would be appreciated.

Hi,

Does anyone know if there is any documentation available on the GEM libraries for GCC? Thanks in advance.

Loved that game (for no good reason, except that in ran faster on a high res monitor...), speaking of which they did offer out the source code for it, I wonder, does anyone have a copy of this source code ? Is there a way I could get hold of a copy ?

Sorry it's a bit off topic, but it's reminded me of the early days of programming my ST (and watching windows hang in space empty not responding to anything, then having to reboot off a floppy .... it took hours for the bruising to go down <grin>).

Thanks in advance,

I'd be interested in getting hold of all of the old Medway Boys and Automation menus from there disks as i've already got quite a collection, and there are not the sort of thing you'd find in a pd library (can't think why!!).

Also, does anybody know at what cd numbers these finished at ?

Yes, they're drawn differently. The Flydial code inspects every tree in the RSC, and upon encountering e.g. an 'IBOX that's CROSSED and has the TOUCHEXIT bit set', it replaces this object with a USERDEF object, which is the 'folded corner' you know. So all the special objects you often encounter (drag-corner, underlined box-titles, mac-look radio buttons, crossed checkboxes, etc) are implemented by dynamically replacing certain objects in the resource with cutom drawing code.
If you're interested in this kind of things, check out the EGEM library (available at atari.archive.unmich.edu I suppose). This is a full featured library that implements all this things and much, much more. It comes as source code, so you can take a look and see how e.g. fly-corners are achieved, or you can modifiy the code to suit your need. And it's free...

Hope this helps.

Hi, Earthlings ;-) !

Just some silly questions. I've mostly used GFA and Pascal for programming, so C is kind of a mystery to me. Despite this, I've (bravely?) installed various versions of GCC on my Falcon's hard disk - and tried to compile optimized 68030 versions of MiNT 1.12. Partly just for fun, partly to see if anything improves.

But... Although I've managed to compile both MiNT 1.12 and the "other" MiNT (something like MH-MiNT, can't remember now..) available in Germany, the results have been somewhat strange.

68030-optimization seems to reduce the size of MINT.PRG a little, but otherwise the speed doesn't seem to improve at all. Should this be so?

Unfortunately, these compilations don't seem to work 100% reliably, either.. Some strange things happen that don't happen when using

"official" MiNT compilations.

I used CGG 2.36 at first, with those results mentioned. Then I tried version 2.5x - but for some reason, I couldn't make it compile MiNT without error messages (using same sources as w. 2.36). Anyway, I've heard that some bug somewhere makes 2.5x compilations useless when using GEM with MiNT.. =-(.

So, what should I expect from GCC 2.63? Is it even more impossible to configure (for inexperienced C-user) - and is there any point in using it to compile MiNT, anyway (greater speed, more compact code, ...) ??

Any experience and/or suggestions?

Thanks,

Tommi

I recently purchased a 1040ST to use with my keyboard and sampler, but I've
noticed that nothing I've seen matches Disk Master for the Amiga, which
I've been faithful to for a good 4 years now. I was wondering if anyone
had a list of the TOS/GEM specific functions in a normal text/ascii file, and,
if so, that person could send it to me via email or if it is already on a
FTP site somewhere. I'm getting a bit eager to actually compile all this code
I've created... Anyway thanks for any responses and hope to hear from
somebody soon!

[Author was Rod McCall]
[Posted on 21 May 1995 15:50:28 GMT]

I have decided that once summer arrives I inted to start doing some
serious programming on my Falcon. At present I have (or will have
shortly) Pure C and Devpac 3. I am also considering getting Devpac DSP.
Do the latter two packages come with information on how to program
the graphics & sound system on the Falcon? Also are their any
books that are particularily good at explaining how to program the
ST/Falcon graphics and sound hardware?

Hi Tommi,

I don't know exactly what 68030 optimization means. Let's see, I'm sure the '030 has some instructions that the '000 doesn't, so if I compiler were worth it's salt, it would take this into account. Probably, it doesn't. I'm just guessing, though. As far as regular "non-denominational" optimization, I wouldn't expect much improvement. I never get much improvement from optimization.

>The command that doesn't work is simply a call to XBIOS 88 (Setmode) with
>the parameter passed from STOS. For some reason, when this is executed (only
>on Rich's system - not on mine), it changes video mode, but then causes a
>bus error (IIRC).

I think the answer is fairly easy. There are two main reasons : video memory size
depends on video mode on a Falcon and ATARI gives shitty docs.

VSetMode should theorically just change video mode. In fact, as the SetScreen call
it also erases the screen. So, if you are in ST low res, which uses approx.
32Kb, then you switch to 320*200 True Color which uses around 128Kb.
If you dont move the screen address, the XBIOS crashes when erasing the screen
(after it has cleaned the first 32Kb).

So, when changing resolution, you must take care of video memory address, or
use the call VSetScreen (XBIOS 5) specifying 0 as logical and physical address.
This call
allocates enough memory for the new resolution and change the video address
accordingly.

Hopin it will help you.

Is this a wind-up and I've taken the bait, or are you serious, Eric? Now I've been writing assembler routines, at first for the 6502 and 6809, then 8086, 68000, various microcontrollers, and 56001, for 12 years, and in C for 6 years. AFAICR, I've never written any C code that looks "like so much spaghetti", or even illogical. I try to code my assembler in a manner which is as structured and clean as possible, but the structure is artificial. In C you must write structured code, it's built into the language - for example: no jumps, function calls with return values, local variables, information hiding, strict type-checking, classes, etc. You can do all these in assembler (sort of) but it won't stop you *not* doing them, and if you don't, your code quality will suffer.

The use of libraries in C is certainly not ungainly. It is the opposite. All similar functions are grouped out of the way, all tested and verified and ready to call upon. The internal code of the library functions, having being tested, does not need to be known about anymore. Do you not have libraries of assembler functions which you call when you need them? Or do you rewrite each function every time you want to include it? What do you mean by piecemeal coding?

I agree with you that there is some satisfaction with coding in assembler. I like it too, but I wouldn't go so far as to put down high level languages with which working code can be generated ten times faster with ten times the quality.

The only time when assembler is useful is when speed, or code size is at a premium. When coding for the DSP, this situation will arise more often, hence DSP routines are mainly written in assembler, although the mundane stuff the DSP does can still be written in C.

If you're writing code as a hobby, write it in whatever language you like. BASIC is great for hobbyist use, assembler is fun. When it comes to professional writing, C and sometimes Pascal are used nearly always because the code must be of high quality, ie. very reliable, and easily maintainable.

There. I took the bait. I'm hooked!.... aargh, ... let me go...

If SPARCstations are so slow, why not buy a different workstation (not a PC)? I had a circular from Digital advertising Alpha workstations from 5000UKP. OK, it's a lot more than a Pentium but you get a lot more - it's the fastest thing on three legs! There's lots of other serious work-stations around that will seriously outperform a Pentium.

Do you SPARCStations use the new 64bit UltraSPARC? I thought that was quite a mean machine (although the review I read said the PPC620 and Alpha were better).

>:>lets delete group then.

No, don't do that. There's still plenty of traffic in this group,

and far too much junk in c.s.a.s to wade through to get to useful stuff
like in this group.

Hello. My name is Loren Dickey. I was wondering if someone could tell me if
the following languages are available for use on my 800xl.

c
pascal
fortran
cobol
logo
any specialty languages

I'm also looking for an editor/assembler and enhanced BASIC languages and
compilers. I have a stock 64k 800xl, two drives, a cassette recorder but no
printer. Any help would be appreciated.

Well I have a question or two. I am new to the newsgroup but not new to
GFA programming, and I was wondering whether there is now a reliable way
of removing both the top and bottom borders?

Also anyone who can remove the side borders ----in GFA---- please help.
Anyone who can remove a single line or multiple lines of side borders
would be interesting reading. It would be nice to write a Hardware
scrolling routine in GFA that does not gobble up memory as much. One
pixel hardware scrolling is easy but takes up more than a 1/2 meg machine
has to give.

Chaz.

Not really on topic, but there's a huge performance difference between a
Linux box NOT networked and one on an ethernet. We have a CDwriter linked

up to a PC running linux, and we disconnect the PC from the net when writing CD's because it can't keep up with the dataflow to the CD when it's busy responding to net traffic. It's a Dell 486dx66 with 64Mb RAM, 2 SCSI Adaptec busses and approx 9Gb disk space, fairly high spec.

Basically I'm saying that comparing the networked Sparc to a stand-alone PC is unfair. And I don;t like Sun's :-) Personally I think they're overpriced for their delivered performance. Get an Indy or an Alpha.

ATB,
    Simon.

And as for full overscan, you can forget it. Full overscan requires time critical code that can only be written in assembler, IF you have a timing sheet and lots of time to experiment. If you just want to display a picture in overscan, and perhaps play some awful chip music, it's not so bad, but if you want to do anything interesting, ie anything, you can't do it in GFA, or any hi level language for that matter.

>will find all this in the programmers clinic pages....

:-) What about those of us who never got ST World? I experimented with bottom-border overscan at one point -- I'd heard that it involved flipping the 50/60Hz bit at some strategic moment -- but I never got it to do more than give me some fuzz in the bottom border. Whatever I did, I couldn't get graphics there, just this "static"-type fuzz. But that's beside the point...

What I'd like to find out at the moment is this:

How do I decide what values to put in the control and data registers of the 68901 to get it to generate interrupts at a particular rate? I'm trying to put together a sample playing routine to work on pre-STe ST's. The Compendium tells me where the registers are located, but it doesn't say how they work!

My other current problem is the sound chip. From reading through some code I was sent (thanks Eero!) I've worked out that you get the PSG to generate sampled sound by setting all 3 channels to generate tones and noise simultaneously, then poking appropriate values into the volume registers for channels A, B and C. I don't know what the formula is connecting a linear sample with the three volume register values. Anyone know? (It looks to me like it might involve logarithms...)

Thanks for your help.

;-)

But not all low-traffic groups should be deleted,
news.announce.important, for example!

If a group has low volume AND a low signal-to-noise ratio, it might be
worth deleting it, but if the group is useful to some people, leave it
as it is. Nobody's forcing anyone to read it.

I personally prefer reading low volume, high signal-to-noise groups.

It would be nice I agree.

I think this has been tried before, but nothing has actually been released
which works.

If it was to be done - it should be independent of the ROM GEM and TOS.
In effect it should be a port of GEM to X. This way it could be recompiled
to work on any X server, including X-MiNT and Linux/68-X11R6

  > X in their software. Even if X requires lots of power, the availabi
  > lity of Atari German clones shows me that we could use this power

> in a great way. The Medusa or the Eagle could become real workstations

X does require a lot of power - and this might be the sticking point. At least on Ataris - MiXT will be very slow. X-MiNT is slow even on a TT, as is linux/68-X11R6. Its not that they are unusable - its just that GEM programs are going to work *much* faster under ROM GEM/TOS.

:-)

Roland.

DevpacDSP is full of bugs...
Many adressing modes are not allowed though they should.

If I have an advice: use the Motorola assembler: a bit slow but it works perfectly. You may need a tool because several programs need to be called, but it's not difficult to write and it has already been written...

I really would be surprised, if ASH sells something like that.
Just ask Volker_Ritzhaupt@ka2.maus.de (the CEO of ASH) or
Oliver_Buchmann@ka2.maus.de, if you want to get further (nonexisting)
details. ;-)

Ciao, Dirk

A friend has given me Laser C version 1.01, all original disls and manuals.
There are three disks, and one disk to upgrade Laser C to version 2.0. However
when I try to start Laser, a dialog box pops up and says Laser C does not run
under TOS 1.06, and that I should use a Patch.prg. Has anyone ever run into a
similar problem? if so, what can you do? is there a patch.prg somewhere that
one can use?
ANY help appreciated, thanks.merci

How do I get Mutt to recognize it's startupfile (ME2.MCO)? The doc says
it will search the current directory, but that seems to fail.

Or is there another emacs style editor (in a window)?

I've just joined this group and was wondering if anyone could help me with this little problem: I've managed to remove the bottom border without any problems, but how do I get rid of the other borders? I understand the principle, but how do I time my interrupt so that it's at the top of the screen to open the top border, and how precisely do I go about opening the left and right borders? I think it's done by waiting until the end of the scanline then switching Hz rate, pause until you get to the left border then switch back before the start of the scanline. Is this right? Am I right in thinking that you have to open every scanline 'by hand' so to speak using the hbl? Do I have to work out the timings myself by trial and error or hacking out other people's code? I've seen quite a few border code sources given away free with mags or printed in mags or on the 'net but none of these have ever worked on my 520STFM (Yes, it's old but it does all that I want it to).

Someone else mentioned a bug in the video shifter that enabled you to do hardware-like scrolling in pre-STE machines. What is this, and how is it done?

Is anyone going to answer this, or are these things that you must find out for yourself by hacking, trial and error, etc.?

Any help much appreciated.

Gaz

Years ago I bought a 520ST and upgraded the memory, put in a clock chip, etc. I still like to use it from time to time, and have a heap of games and shareware for my kid to learn with and play with. It's perfect for her, and every once in a while I like to do a few things with it...

I've got a fair bit invested in this computer, and it's very workable. I'm ridiculously out of date on my info about the Atari world, so please, folks, don't laugh at my questions.

First of all, where can anyone find support for this computer? I have seen, progressively, loss of support and sales of hardware and software for my Atari in the U.S. I'm in the U.S. Southeast, anyone know of sources anywhere in the area, or in the U.S. for that matter?

Specifically, I'd like to use a monochrome monitor for some of the CAD programs I purchased. The emulators just aren't any good. I have an IBM VGA monochrome monitor (quite nice); is there a way to modify somethin inteh Atari or monitor to make them talk to each other? I think they are compatible re the resolution; just not sure regarding the refresh rate, which I seem to recall was 60Hz fo rthe IBM and 70 Hz for the Atari.

Someone mentioned a Falcon. What's that?

OK, Devpac DSP is not PD, but is only(?) 50 pounds and is pretty good
although it has sparse documentation. It is obviously written in C
but it is quite fast and stable. There is one bug I've found with using
too many labels that start with the same letter(s).

I still recommend it.

Alan.

p.s - mail me if you want to discuss DSP programming at all.

careful: numerical recipes is very buggish, they converted fortran code to
c to get the c libs. arrays in fortran start at index 1, arrays in C start
at 0.... this creates lots of bugs!

I'm probably opening the flood gates, but I am suprised that there seems to be little programming support for Basic, particularly GFA.

I love trying different languages and personally speaking I haven't found the perfect language.

I program utilities & applications on a Falcon for ST/TT & F030 and I have found GFA basic supported by C or assembler is the best compromise.

Most people have a very poor view of Basic, expecting to see poorly structured code with GOTO's all over the place. GFA is a breath of fresh air, giving a fully structural environment with clean code and apart from having to introduce machine code for memory blitting or clearing, rarely is GFA unequal to the task I have set it. Using GFA I have written programs to carry out direct to disk recording & playback whilst controlling 256 lights at 256 different levels at the same time, good enough to run in a major hotel chain.

A text editor which has many features up to twice the speed of many other editors, giving word wrap indent and many other features in a full Gem environment all sat in 60K.

A Full colour icon editor which handles 16 colour full 3D button menus which pop up & down. Allowing icons to be ripped from practically any source. converting BMP & IBM colour format in real time.

A full 3D X-window's & mouse driver system that runs in the auto folder that controls the boot up of my falcon.

C is very good if you program by putting blocks of pre-written code together or using standard methods or techniques for getting around problems. But if your like me and you write straight off the top of your head get GFA Basic V3 you'll get your theory straight - fast.

Assembler is great for speed but is lousy at handling the unexpected. If your program has fixed bounds (eg working within the screen boundaries or a number between fixed confines) it is relatively simple, the problems start to arrive if you code it to handle the unexpected. You can quickly end up with a routine twice or three times the size of the original just trying to make the code as stable as possible under all conditions.

I understand for games that to get speed you really need to go to machine code but for most everyday requirements a good Interpreter & Compiler basic will out perform practically all other languages in terms of speed of coding, structure, de-bugging & alteration.

GFA has commands which allow full file control, piping & redirection, full Gem & Event management access either by preset commands for VDI & AES or if you need less common commands you're given access to the GEM paramter block tables and full A-line access. TOS is covered by access to the GEMDOS,BIOS & XBIOS with full matrix manipulations, array sorts and enhanced string functions. All supplied with full error checking & debugging functions. Unfortunately GFA is weak in the sound & sprite department and usually needs

support from either C or assembler which can be incorporated inside the basic program or linked in during compilation. Even then it doesn't stop, giving symbol tables, error trapping & dynamic memory allocation even when compiled if so desired. Also you end up with a completely clean stand alone program roughly the same size as the tokenised source.

This piece of code checks to see if a variable file exists and then loads the first variable number of lines (any length) of a text file (0=all), and append it onto a second variable file. If the first or second file doesn't exist it will display an alert message saying so, if the variable number is <0 it will return an error(-1) or it will return back the total number of lines transfered.

```
FUNCTION append(file1$,file2$,num)
  LOCAL total,num_lines,max_line,button
  IF num>-1
    IF num=0
      max_line=2000
    ELSE
      max_line=MIN(2000,num)
    ENDIF
    IF EXIST(file1$)
      IF EXIST(file2$)
        DIM line$(max_line)
        OPEN"I",#1,file1$
        OPEN"A",#2,file2$
        num_lines=0
        REPEAT
          RECALL #1,line$(),1 TO MIN(max_line,num-num_lines),total

Is it possible to use polling (of RDF and TDE in the SSISR) to check if
the DSP has data for reading or writing to the ADC/DAC?

I find A56 works OK. This is PD and I got it from New Age PDL (which unfortunately I hear is closing down). I normally use DevpacDSP from HiSoft though which is much better, and has a debugger.

> without any problems, but how do I get rid of the other borders?

Quite tricky. Well, the upper border is quite easy, it's the same trick that with the lower border, just that you have to do it without timer B. :) The easiest way is to first sync with the lower border routine, and then restart the timer B so it will interupt at a specific point in the upper border. I've released a source that removed the upper and lower border in GEM (this code also offers stable borders with the blitter enabled in GEM).

Removing the left and right border can drive one crasy, cause the timing has to be done very good. The technic is quite simple, just fiddle 50Hz to 70 Hz to 50 Hz in the left border, and in the right, fiddle it to 50 to 60 to 50. Has to be done on every scanline.

When syncronising, read the lower shifter adress, and jump by offset into some

NOPs, and you will get it synced.

The trickiest part is not to get it to work on your own machine, but to make it work on everyone else machines!

S94 (gjones@cs.man.ac.uk) wrote:

: Someone else mentioned a bug in the video shifter that enabled you
: to do hardware-like scrolling in pre-STE machines. What is this,
: and how is it done?

This "hardware-like" scrolling (also known as "sync"-scrolling) fiddles around with opening left and/or right border. It basically emulates the low byte of the videomem starting register, which does not exist in normal ST's. Every opening of borders means, that more videomem is being displayed. A normal scanline consists of 160 bytes. If you open the right border (which is relatively easy compared to the left one) it consists of 160+44=204 Bytes, as the Shifter displays 44 more Bytes (don't worry about the odd numbers - the planes will indeed be shifted on the next line!) If you open the left border as well, 26 more bytes will be displayed wich gives us a max of 230 bytes per scanline.
What you do now is to open different pairs of borders a couple of time at the top of the screen to get different negative offsets of the beginning of the remaining screen, eg. open the right border twice and a point further down the screen will start 88 bytes earlier. There are more things to it: There are a few methods to get different offsets than 44 or 26. By changing the timing you can get offsets of -2 (yes! you actually can reduce a scanline to 158 bytes!) and 24 (combination of -2 and 26). -2 and 44 work for the right border and 26 uses the left border. This gives: -2, 24, 26, 44 and 70 bytes offset. Now its up to

the coder to find all useful combinations to get all desired offsets.
Note: you still can use the mid byte register of the screen address,
eg. when you want an offset of 120 = 256-70-70+2+2.
It is possible to achieve a full emulation of the low byte in 7 scan-
lines.

Of course you cannot use those seven lines for your graphics, as they
would be distorted. On the other hand you can combine opening the top
border with sync-scrolling.

Well, this was the logical problem. Now comes the programming prob-
lems: First of all you have to synchronize your code to the raster
electron beam in your monitor or tv. If you are not synchronised,
you cannot open left or right border, as these need to be switched
on a particular position, unlike the lower border, where you switch
Hz "somewhere" after the last line.

And here we've got a problem: I'm no longer active on the Atari ST
since about 2 Years. I don't have the code anymore, and I can't make
up everything from my mind! But: A source code for sync-scrolling
in seven scanlines has been published in the german "TOS" magazine
back in 1992, and it has also been on various disk mags. It's been
written by our member New Mode (the infamous one ;-)

Anyway - I hope I managed to help you a bit!

Cheers,

Gunnar (ex- Big Alec of Delta Force / Union)

P.S.: It also was Delta Force who hacked NEOchrome and made
NEOchrome Master (I write this, because someone in a thread
before this one didn't know...)

P.P.S.: Don't bother to contact me about any coding activity of DF.
We are dead! We are no longer! We ceased to exist!
We are EX- coders! (hum.., er, computerwise of course)
(the above was inspired by Monty Python (of course!))

No, really: We are no longer active since 1993 but I still
get letters from people who want to get music from me...
(mostly from France though...)

Anyway, if you just want to chat a bit (about the good ol'
times on ST for example) you're welcome, of course.

I don't have the facilities here to do a full-scale description of an answer to your problem about the MFP since I don't have my ST here (it's at home right now), nor do I have any of my source disks around. I'll do that when I go home tonight and post a full reply to your question, and a source that'll replay a sample under interrupt.
Here's a short snippet of code though that'll show you how to remove the bottom border and also give some insight into using the MFP:

```
; setup screen, set supervisor, etc etc, goes here
     bsr  save_ints ;    save all the interrupts, etc
     clr.b    $fffffa07.w   ;    stop MFP ints
     clr.b    $fffffa09.w
     or.b #1,$fffffa07.w     ;    open timer b channel
     or.b #1,$fffffa13.w     ;    mask timer b
     bclr #6,$fffffa09.w     ;    keyboard (I/O port bit 4)
     move.l   #key,$118.w   ;    new keyboard vector
     bset #6,$fffffa09.w     ;    open channel
     move.l   #vbl,$70.w    ;    new vbl
     move.l   #emptytb,$120.w    ;    empty timer b
     move.w   #$2300,sr ;    start interrupts
; your other code here, exiting is simply a matter of stopping the ints
; and restoring all the original ints
;
vbl
     move.w   #1,vbi_flag   ;    flag it
     clr.b    $fffffa1b.w   ;    b control reg (stop timer b)
     move.b   #199,$fffffa21.w   ;    timer b data
     move.b   #8,$fffffa1b.w     ;    event countdown mode
     move.l   #bottomtb,$120.w   ;    new timer b
     rte

bottomtb
     move.l   a0,-(sp)  ;    save regs
     move.w   d0,-(sp)
     clr.b    $fffffa1b.w   ;    stop b
     lea.l    $fffffa21.w,a0     ;    a0 -> timer b data
```

```
     move.b    #?,(a0)        ;    number of scanlines
     move.b    #8,$fffffa1b.w     ;    event countdown mode
     move.l    #emptytb,$120.w    ;    new timer b
     move.b    (a0),d0        ;    get data
bottomtb_loop1
     cmp.b     (a0),d0        ;    wait until end of scanline
     beq.s     bottomtb_loop1     ;    ie, in the right border
     move.b    #2,$ffff820a.w     ;    60 Hz
     lsl.w     #8,d0          ;    wait until in the left border (62
     lsl.w     #8,d0          ;    cycles)
     lsl.w     #6,d0
     clr.b     $ffff820a.w    ;    50 Hz, no bottom border
     move.w    (sp)+,d0 ;    restore regs
     move.l    (sp)+,a0
     bclr #0,$fffffa0f.w      ;    acknowledge interrupt
     rte

emptytb
     bclr #0,$fffffa0f.w      ;    acknowledge
     rte

; Ok, now I think that's all correct, but I've had to do it from memory, so
; I hope I've got it right. I've just had a look at it again, and I think
; that it's right.
```

Here's the general idea for using the MFP, in this case, the timer b interrupt:

First, you've got to tell the MFP that you want the interrupt switched on. This is done using the interrupt enable registers (IER's), where each bit represents a different interrupt. This is done at the start in the code above.

Your vbl stops the timer b via the timer b control register, then sets the timer b data register, and then restarts the timer b. In this case, we're using event countdown mode, which simply means that each timer b event (ie every scanline) we decrement the timer b counter. When it reaches 0, it jumps to the routine whose location is stored in $120.w. Thus, the 199 used in the vbl means wait for 199 scanlines and then run the 'bottomtb' routine. Simple really.

Now, the bottomtb routine. Since we don't want this routine to run again when the counter finishes (it might finish before the vbl gets round to resetting the counter, which would lead to trying to open the bottom border again, only it would be trying at the wrong place.) we stop the timer b, set the data (there's a '?' where you can put however many scanlines you want the routine to run for), and then set it to event countdown mode again and set the new routine we want it to use after it's finished counting down. Then we do our code for the routine (in this case, opening the bottom border), and then we acknowledge the interrupt and rte. We have to acknowledge the interrupt since when the interrupt occurs, a bit is set in the interrupt in-service register A (ISR A) that says the interrupt is on. However, it isn't cleared at the end and so we must do this ourselves, and thus allow other interrupts to happen on that channel. Bit 0 corresponds to the timer b channel. Funnily enough, this happens to be the same bit as the one we set in the IER A register to turn the timer b on, and the interrupt mask register (IMR A) that we used to mask the interrupt.

Spot a pattern? This is essentially how the MFP works.
To get the full use though, you'll need a few examples and a list of which bits control which channels (ie interrupts). I've got one, but not with me, so I'll post that tomorrow.
Hope this helps in some way. If I've lost you at all or confused you then hopefully my next posting (a more detailed explanation of the MFP) will clear things up.

Your thinking is about right...
You can't use the HBL though (not reliable anyway).
In the VBL-interrupt do the following:

```
.loop    move.b   $ffff8209.w,d0
     beq.s    .loop
     not  d0
     lsl  d0,d0
```

What this does, is that it syncs the CPU to the raster beam in your monitor
This is needed to get the sync switch at the exact correct position.
Since it was quite som time since I did this kind of stuff, I can't give
you the correct positions, but it involves all possible syncs,
(50Hz, 60Hz, 71.25Hz (ST-HIGH)).
You'll also have to shut the interrupts off to be able to switch to ST-HIGH,
on a Colour Monitor, and remember to be careful, since frequencies at that
rate actually can damage your TV, och RGB-Screen.

If I remember correctly the left border should be removed if you, at the
end of the line (that's the graphics, and not the scanline) switch to ST-HIGH,
wait about 6 nop:s and then switch back to 50Hz.

The bottom I believe is removed by simply setting the sync to 60Hz wait a while
and the reset it to 50Hz (It's not so important to be exact here, so if you
want to remove the lower border, but not left and right you can use the HBL)

You are also absolutely right that you'll have to do the syncchanges on every
line, and this take a great amount of time.

That's all for now...

Good Luck...

Parts of GemFast certainly seem to be broken with newer versions of the AES and or/mint. It's a while since I used it (at least a year and a half) so I don't remember it all that well, but as long as certain calls are avoided (particularly IIRC those involving the extended GEM features such as popup menus and so on) it's just about usable for access to standard GEM calls. It is, however, way out of date and doesn't provide support for vector-font based GDOSs or any of the new AES facilities. GNU + gemlibs is a much better bet.

ATB,

Martin

Printf has tons of other stuff in for converting float, int, char etc and for displaying these in ASCII (which is a big job, I know from experience). I always use puts() if no formatted text is necessary. This compiles much smaller (at least on the PC it does), and should just do the Gemdos call.

I am considering writting a 68000 simulator for a PC and i was wondering what would be the fastest method for decoding the instruction set.

A huge look-up table, or decoding the instruction bit by bit ..?
Any ideas?, or is there any source code available which already does this, if so, where.

Thanks.

I don't know. I am now working on Edith Professional 4X. Basically what I am doing is writing lots of the AES code in terms of X drawing functions. So it still is a GEM program in many respects. Now I know that my 486DX50 is much faster than my TT, but the X version is definitely _much_ faster and more efficient than the GEM equivalent.

I don't think that emulating the GEM calls would be that inefficient under X Window. I suspect the result would be faster in performance than a GEM program running under MultiTOS.

My experience of emulating the spectrum was to use the lookup table; but that
would take lots of memory. You might be able to get away with a high byte look
up table and several low byte tables - that should still be fast and allows a
lot of compression for the $axxx and $fxxx instructions (a-line and f-line).
NB use jump tables not just lookup tables - they are a lot faster.

I think the answer is returned by the aline0 trap in one of the registers. I seem to remeber my lattice documentation saying that.... but that is from memory

I use a Visual Basic clone for OSF Motif on the HP700, same enviroment, but uses ANSI C, K&R C, or C++ (it's called VXP - if you use Motif, get it it's great).

I've been thinking for a while now that it might be nice to have one for the Atari.....probably to directly support code generation for DULIB1.3? - the new libs release is coming RSN, with popups, windials, callbacks, custom redraws, Icon popups (like in CorelDraw), scrolling list, full text editor widgets, etc) all fully documented in english, and ready for use with Lattice C.

Craig.

Hello to all GFA Basic programmers

I have been trying to get GFA Basic compiled programs to run under Magic.

There is a patch program on various ftp sites (GFA patch 1.07) that is supposed to modify the compiler libraries. The only problem I have is that the documentation is all in German!

Has anybody used this patch succesfully, or does anybody know where I can get hold of the documents in English.

Contact me at the address below.

Thanks in advance.

Yes, try "The ATARI Compendium".
It's an American book, written by Scott Saunders. You should be able to get it from System Solutions in the U.K.
The book covers all Atari computer models and system calls etc.etc.

But there is also the more Falcon(or better)-specific book named "Modern ATARI-System software", I think it's from HiSoft.

Hope this helps. :-)

Keep Cool and Flying...

Are you sure these programs (devpac etc) will run on your new oric ?

There are several books around that are good for the atari such as the abacus books (if you can find them) however, the best source in my opinion is magazines (new & old) and source code off the net. Generally in my experience most of the atari books aren't set up to learn from, or if they are. They only take you so far then your on your own. Although I must admit that I haven't seen several of the "newer" atari books. I do recommend the Atari Compendium. The ability to only have to look through one book most of the time, is well worth the money when you consider how long it takes to look through all your old books, Magazines and source code.

There is a file that shows how to do resouce's inlined. However I just checked and didn't see it in the Gfa section on a.a.u.e. I will try to track it down and put it there. I have it at home so if nothing else I can get it up later this week.

I understand that spectrum 512 and photochrome work by trigerring events
at the right times for the monitor to display a different colour. Can
someone please tell me these monitor timing so that I can investigate how
to do this for myself.
thanks,
     Chris.

I am trying to write a MultiTOS friendly Gem based application (in assembler).
I have an event handler that handles dialogues placed in a window, but at the
moment it ignores keyboard events.

I have got it to detect keyboard events, but where can I get the value of the
key that is pressed? What form is it in - ASCII / scancode?

Cheers for any help.

Anthony (who has NO aes documentation for calls implemented before v3.3)

Just a quick request - I just downloaded eGEM 2.1 (Sep. '94 version) and it
looks pretty interesting (from my reading of the docs and source) BUT . . .
my German is, shall we say, rudimentary (esp. when it comes to the finer
points of TOS/GEM/C coding) SO . . .

Does anybody have any English docs for the eGEM library, and, if so could they
mail them to me or point me at a site where I can get 'em (either ASCII or
.hyp) I got eGEM from the (excellent) UMich mirror at Imperial but there was
no sign of any EGEM_ENG.LZH or such there.

TIA (for time and bandwidth :)

Subject: Two VDI questions
Date: 1995/05/23
Message-ID: <3ps4i7$9sg@nyheter.chalmers.se>#1/1
X-Deja-AN: 103110227
organization: Chalmers University of Technology
newsgroups: comp.sys.atari.programmer

As one of the very last additions to MGIF before the new release,
I intended to implement some limited support for graphics cards.
The first of my two questions is only performance related, but the
second describes a strange problem I've run into.

1. Device specific formats for 8 bit modes
   My current routines first translate from the stored byte per pixel
   format to the normal TT/Falcon bit plane structure. The bitplanes
   are then reordered to fit the VDI 'standard' definition.
   Finally the normal VDI transform and blit functions are used.

   While the above works fine (apart from the problems described later),
   it's clearly very inefficient on graphics cards, since those are
   likely to use a byte per pixel format. Going from byte per pixel to
   bit plane and back again takes quite a lot of time.

   I will of course include the full operation outline above, for maximum
   compatibility, but it would be very nice to speed the process up for
   'normal' graphics cards. So, does anyone know what the device specific
   format (MFDB) looks like for such a card in eight bit mode?

2. VDI colour setting problem

On my Falcon with TOS 4.01, the short test program below works fine under a 4 bit mode, but not under an 8 bit one. NVDI does not help. The problem is that (physical) colour number 15 is always set to zero! I guess this must be due to some kind of mistake on my part, since I've never seen any other program display this kind of behaviour. I haven't got the slightest idea about what the bug could be, however.

A Falcon executable version of the program can be found at my ftp site, rand.thn.htu.se under the name testcol.prg. If anyone wants to compile the test code on a TT, the VgetRGB must be replaced and the handling of 'map' changed.

```
/* The list of include files might need to be changed/extended
 * for some compilers.
 * Atari specific functions used are:
 *   VgetRGB (only exists on a Falcon), vq_color, vs_color,
 *   appl_init, graf_handle, v_opnvwk and c_clsvwk
 */

#include <vdi.h>
#include <tos.h>
#include <aes.h>
#include <stdio.h>
#include <stdlib.h>

/* VDI colour permutation */
int permute[256] = {0, 2, 3, 6, 4, 7, 5, 8,
                    9, 10, 11, 14, 12, 15, 13, 1};

/* Test colours */
int colour[20] = {100, 500, 700, 200, 840, 900, 250, 130, 670, 800,
                  130, 530, 760, 260, 720, 450, 780, 990, 290, 300};

void main(void)
{
   int i;
   int rgb[3];
   int handle;
   int work_in[11] = {1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 2};
   int work_out[57];
   int junk, colours;
   long map[256];

   appl_init();
   handle=graf_handle(&junk, &junk, &junk, &junk);
   v_opnvwk(work_in, &handle, work_out);
   if (!handle) {
      appl_exit();
      exit(-1);
   }
   colours = work_out[13];

   for(i = 16;i < 256;i++)
```

```
      permute[i] = i;

   for(i = 0;i < 20;i++) {
      rgb[0] = rgb[1] = rgb[2] = colour[i];
      vs_color(handle, permute[i], rgb);
   }

   VgetRGB(0, colours, map);

   printf("Physical colour #: from VgetRGB, from vq_color  (original)\n");
   printf("Values can be off by +/- 1 due to rounding.\n");
   for(i = 0;i < 20;i++) {
      vq_color(handle, permute[i], 0, rgb);
      printf("%d: %ld,%ld (%ld)\n", i, map[i] >> 16,
             (rgb[0] * 255L) / 1000, (colour[i] * 255L) / 1000);
   }
   scanf("%d", &junk);

   v_clsvwk(handle);
   appl_exit();
}
```

Is there any way to put a autoboot GFA basic file
on the disk so that it automatically loads and runs
on booting. I know it can be done in STOS by naming
the file autoexec.bas .

It's good if it's possible to change the .RSC. Then I can make a own
translation of the language to swedish (for own personal use). I like programs
have the .RSCfile loose, so that I can change it for my own perposes.

The important parts of MiNT - switching from one process to another, preemptively - are already written in assembler. So the general speed cannot increase so much - but several things like pipes should run faster.

> Unfortunately, these compilations don't seem to work 100% reliably,
> either.. Some strange things happen that don't happen when using

What kind of things are these? I use MH-MiNT1.12h2 without restrictions. But I never used an official release - so I don't know what happens there.

> I used CGG 2.36 at first, with those results mentioned. Then I tried

> GEM with MiNT.. =-(.

I've been using gcc 2.5.8 till now - and there were no problems. The bug you mention was removed, I think. There can be problems using older versions than 2.5.8.

> So, what should I expect from GCC 2.63? Is it even more impossible to
> configure (for inexperienced C-user) - and is there any point in using it
> to compile MiNT, anyway (greater speed, more compact code, ...) ??

Don't expect any miracles :-). There may be a slight increase in speed and more compact code length - but I don't think the improvements are so big that you get 10% less code and 10% more speed. But IMHO you should use the newest thing you can get.
I want to install 2.6.3 some time - I already looked how much space I need, and I didn't find any huge difference between 2.5.8 and 2.6.3, only a few regarding the port (e.g. where libraries are searched and under which name).

I've not used tcc <move> <parallel move> but I've used tfr <move> <parallel move>

Don't forget that you must put your parallel moves in the correct order for the assmebler, i.e X: Y: and you canonly use the correct address registers for the move.

I always use binary files, and they seem to work fine so I can't really comment on the LOD problem although when I have used them they seem to be fine.

THE KEY TO ORGANIZING YOUR HEALTH RECORDS

"If you care about yourself and your children, you will do everything you can to know your family's medical history. It can save your life, and the lives of those who are dear to you." -- Dr. Aubry Milunsky, Director, Boston University's Center for Human Genetics (Life Magazine, March, 1995).

Your Lifetime Health Planner offers the simplest, most effective way to take charge of your health. Enter important facts about your health history, keep a record of the names of medications and their effects, document each doctor visit and diagnosis. You will have the information you need, and in the event of an emergency, so will your family.

Your Lifetime Health Planner, 198 pages in a compact, loose-leaf binder, contains a variety of sections which include "Doctor Visits," "Medications," "Family Health History," and "Doctors and Specialists."

The Planner is a must for the busy executive who needs to stay organized, for seniors who are receiving care and for newborns who need a record of their health care.

Parents Magazine recommended the Planner to its readers (April, 1994) and MCI called it "a useful resource in managing your personal health records." Margie Smotherman, Coordinator, Employee Health and Wellness, Blue Shield/Blue Cross of Iowa, said: "The employees felt that these (Planners) were great tools to not only record their pertinent numbers, but to plan for doctor's visits."

To get your copy, send a check or money order for $19.95 (plus shipping and handling) to :

m> I'm busy writing a program in GfA, completely multitasking, dialogs in
m> windows, menubar present (in 3d colors), very neat all, but I seem to

From the description I would say your project is doomed to failure.
I mean, "cmopletely multitasking", if it means multitasking friendly...
Doing that with GFA basic is no fun. I'm an ex-GFA programmer ;-).

m> have one question: Is it possible to INLINE my resource file, because I

I think just load it to INLINE. But then you can't use the
rsrc_load() call for loading the resource and adjusting it to
the current resolution. You'll have to use rsrc_obfix for it
adjusting the different objects...
    I have never done that with GFA, but I think this is how it's
done.

m> hate the programs where you can easily change the resource files by
m> yourself!

Hey, that's one of the nice features of RSC-files! User can edit
a bit the rsc-file, if something isn't like he wanted.

Yes, you must COMPILE it first with the GfA Compiler. If you do not have
the compiler, then you must purchase one (preferably version 3.5 or 3.6TT).

If booting from the AUTO folder, then the program must not make use of
GEM specific routines and commands.

If the program needs GEM, then you must have the Desktop (version 1.4+)
auto run it or use a program like Headstart run it.

No. Unfortunately they don't. The DevpacDSP manual is especially poor in this respect. It has a brief introductory chapter on accessing the DSP from the 68030, but the rest of it just describes how to use the assembler and debugger, although it does this well.

> Also are their any
>books that are particularily good at explaining how to program the

The Atari Compendium is quite good. HiSoft's Modern Atari System Software (or something like that) has much the same stuff as the Compendium, but mostly for the Falcon. In fact, the Compendium is probably a better buy IMHO, even for the Falcon.

Dregor Duchalski's 'Flydial' GFA code contains the required routines to inline the RSC files....though you'll have to register to get these functions - they are not contained in the demo version avaiable from most german FTP sites.

Try 'Real time 3D graphics on the Atari ST' by Andrew Tyler, from Sigma press - quite a few useful algs. to be found there; however, as it was written for the ST there is no DSP source.

It depends on what you want to do - remembering that Papyrus is written
in GFA BASIC (I think I heard that somewhere). Don't bother with
assembley, but try C if you really want a change.

Is it possible to reset the Falcon DSP from the CPU or is there some other way to force the DSP "under CPU control"? CPU reset instruction might just do the trick - unfortunately it only seems to completely jam the CPU. Does anyone know if there's a way to succesfully continue program execution after reset instruction (on Falcon)? (There is a reset instruction in the beginning of the ROM code, but...) Any idea what to do when exception vectors inside the DSP are corrupted, DSP program gone mad and connection to the CPU lost?

Well, I use C (Lattice 5.52) and 68k (DevPac 2) - mostly C 'cos I'm lazy
like that. If you get a good Bios/XBios library and know how MIDI works
then it's fairly easy; any reasonably well-implemented language should do
(one of these days, I'm going to write a patch dumper in Fortran as a mark
of respect to a great language). If you want MIDI tech. docs, they're
archived at ftp.cs.ruu.nl (can't remember the directory - I think it's
pub/MIDI or pub/sound/MIDI) One thing - if you're working w/ sysex (which
I assume you will be) then you'll also need the manufacturers' sysex docs
(ring them and ask - they're normally pretty good. At least Akai and Yamaha
are - I don't know about Roland.) Watch out for little hidden sysex novelties
(8-7 bit conversion's always a good one, as are checksumming and
handshaking :)

Hope this helps.

I would use C, because there exists some very good C compilers for the
atari, and one of the powers of C is ability to do very low-level
stuff. In addition, I seem to remember a few tutorials along the lines
of "MIDI programming in C". If you get your hands on these, then the
choise of language is obvious ;-)

>I havent done alot of programming but I *really* want to learn.

For this kind of "goal-oriented" programming, C is most likely the
best. But if you want to learn programming, you should also broaden
your horizon with other programming paradigms, such as functional
(SML, lisp), or logic (prolog). A good programmer (imho) is
multi-lingual, not tied to a specific language or paradigm... (jm$0.02)

I've asked more than once in the comp.sys.atari.* groups to no avail, and now that it's imperative that I know, I'm really not happy. So I'm begging you. Could someone please tell me how to do these things on the falcon? PLEASE?!? I'm begging!

I need to do this at 12.5 khz, and if it's only close, I'd like to know the exact rate. For playing, I want to do 8-bit MONO.

1. Play a sample on the Falcon.
2. Find out when it's done playing.
3. Record a sample on the Falcon.
4. Find out where the machine is currently recording.
5. Find out when the record buffer has run out.

I've written code to do playing on the Falcon, but it's not very good, and both the Lattice C documentation and the Compendium give me no useful information. They give the commands, but no clue about which ones are necessary, and what order to make the calls in. I really need source code to do this, but I've found absolutely NO examples. Could someone who knows this really well please give me code to do this, with comments would be nice since I need to adapt it to what I'm doing.

Thanks very much!

Hi,

the following programm completly reboots the the DSP. (it's the original TOS-Routine, this routine is called only after the reset, you can't call it with traps ...)
This routine installs all necessay transferprogramms.

A competition for programmers is held between May 5 and June
30 by PRAT/ESF, a french publishing company willing to promote
the creation of software adapted to french audience.
Hence, the programs should be written in french, and be of
french interest.

This competition aims to stimulate and contribute to the dissemination
of french subjects and language orientated software.
Entries should fit in the following categories:

```
   Education - eg: Mathematics, literature, geographical, science, any...
   Recreative - eg: travel planner, drawing program, garden assistant,
                cooking recipes, any...
```

Personnal data management : bank account, taxes, pocket money, any...
Games and animations
Children's corner software

Either PC or Mac platforms should be supported
****
Winners may receive as prize:
Video Recorder
CD ROM players
Corel Picture CDs

The prize-winning shareware software will be made available via internet and online networks
****
To compete, write your own shareware and submit it before June 30 to the above address.

Concours Shareware France
ESF
17 rue Viete
75854 Paris Cedex 17
FRANCE

I tried to email you a couple of times but nothing worked. All I had
to say was that Laser C 2 (actually 2.1 I think) works fine on a MSTE
(TOS 2.05). I did find some incompatibilities on occasion running the
Laser Shell program though; if that happens you can just run the
compiler/linker etc from gulam or whatever. Don't know anything about
a Patch program, unfortunately.

A little software patch will allow you to sort that out. If you INLINE a
few times then you can move it to a different place in memory afterwards.

Dear everybody,

I`m still trying to hook my Mega keyboard to my Falcon...
I thought that possible, but can`t figure it out anymore.
Any hints greatly appreciated!

Christian

GEM isn't even loaded yet. I'd like to see how you make a GEM call
successfully without GEM even being initialized :-). You can, however,
use your own mouse and window routines independant of GEM.

I am about to start my dissertation for university on DSP programming
(3D graphics). I have downloaded several pieces of software and all
have an MSA extension. Now, I may be a bit thick, but having had an
Atari of one decription or another for several years now, I never
heard of this!

Anybody help in this one? (It does seem stange to me that MSA is ASM
backwards, any clues?).

Also, any more info on the DSP would be very (very, very, *very*)
gratefully received ---

: ST stuff? Also, how much would it cost me, cos I am a student!?

: Is it worth continuing with GFA Basic, or is it better to learn Assembley?

: Fraser S Keith

Sure, GfA is easy to program in, but it is no longer being developed. I

like it quite a bit myself. However, I recommend programming in C and it is a commonly used language on all computer platforms and can help a lot in acquiring employment in such a field. However, C is cryptic, but still easier to read than Assembly.

It's a matter of taste. Assembly allows you to program very fast software, but requires longer coding to get te result. C, on the other hand, does the hard work for you and is reasonably fast for most programming projects.

As for GfA, I only know of a USA distributor of GfA. They are called "Toad Computers" and their web address is:

http://www.charm.net/^toad/   The ^ is actually the approximate sign, but my Email editor will not let me type it.

Email is:

TOAD@charm.net

Good luck!

.MSA is a packed format designed for packing floppydisk's.
There is a .MSA-unpacker&packer on ftp.cnam.fr under the
directory 'pub/Atari/Archivers/'. The filename is
'msa_2_3+.prg'.
You must have some free floppy's ready when you start unpacking
the .MSA-files. The MSA unpacker copy all the contents down on a
floppy-disk.

Hope this helps..

Keep Cool and Flying...

|> questions I have posted to this group have been met with complete silence.

Not quite omnipotent - the wait for either button evnt_multi() call isn't documented there. There's a lot of stuff that isn't in any books, like the shifter bug scrolling technique for pre-STE machines (gives smooth scrolling like the hardware scrolling of an STE but using a 'feature' of the original shifter chip), and overscan (dead easy into the bottom border, but much harder to overscan all 4 borders). Even displaying 512/4096 colours isn't documented in the books (at least the ones I've read). Of course, anyone with some old ST-World back issues will find all this in the programmers clinic pages....

Craig.

: But I'm sure there must be advantages for coding directly in
: assembler. Can anyone tell me what they are? ;-)

Pure speed. Try doing any one of the demos ou see in the average demo in C. I also find assembler to be far more elegant than C, which to me, looks like so much spaghetti, and looks rather illogical besides. Assembler has a particular appeal; it is pure logic plain and simple, and it commands good structure and optimised coding. C, with its ungainly libraries, promotes piecemeal coding, which I've never liked.

  Besides that, it takes 8k to write a program that prints "Hello world!' to the screen. I am still very impressed by Torbjorn Ose's ability to fit an 8 level logic game _with_graphics_ into 780 bytes.

newsgroups: comp.sys.atari.programmer

I am currently writing an interactive form designer, running inside GEM windows.

As i am trying to make everything just "drag and drop", I needed to write my own form handler using form_button, form_keybd etc. (In essence I am trying to put a more visual front-end on my program instead of the convoluted dialog boxes that I could've used)

However, I have found that I am unable to do so, because of an undocumented bug/feature of form_button: if the left mouse button is down when form_button is called, the machine just hangs until the button is released.

This is especially bad, since I have an "icon bar" in the window, and, when an icon is clicked, you can simply drag it onto the form. Having to click, release and then click again is not intuitive to my user, who needs to design data-entry forms.

I have looked in The Compendium (April 1994 edition), but it does not mention this problem with form_button.

Does anyone have a solution for this (apart from writing my own code to emulate form_button?)

The pseudocode of my algorithm is as follows:

```
     "Click!" - a mouse button click was returned from evnt_multi
     Find window under the mouse
     If window contains a form
          Find object under the mouse
          Call form_button to (de)select object, change edit field
          If this object requires special handling
               Call handler
```

```
        End If
    End If
```

I am using an Atari TT/030 with TOS 3.05, GEM AES 3.10.

This problem also occurs under MultiTOS GEM AES 4.0, both with and without memory protection.

I have 20Mbytes of RAM installed, of which 14 to 15 is free when the program is running.

Hi,

Can anyone help me? I am using Lattice 5.6 and writing a GEM application. Whenever I type ^S into my app it acts as an XOFF, and needs to be followed by a ^Q (XON) before the keyboard will work again. I think its only because I have MiNT loaded but how can I get around this problem?

Thanks for any help.

Does anybody have a patch program to get around the bug in the Falcon TOS that only allows you to have 17 files open at one time?.

Or is there another way to get around this?

Thanks.

When using certain programs on the Falcon e.g Superboot 8.1, the
return key produces "^@", I have also noticed that most of the
time any attempts to get a c program (which i have written)
also fail to read in the keyboard properly.

Has anyone else had any difficulties?

I am currently using TOS 4.01

>the screen. I am still very impressed by Torbjorn Ose's ability to fit an 8

Not if you use your own libraries and use Gemdos calls ;-). The code for
printf is quite big, especially if you include the float parts...

Regards, Christer.

b> have MiNT loaded but how can I get around this problem?

I use MiNT all the time(actually MultiTOS), and haven't have that
kind of problems. Also I'm writing programs with Lattice 5.6...
In my experience, that problem occurs only if you use some
BIOS calls, such as writing to screen with printf or put etc.
I just tried to press ^S in a GEM program I've written and
keyboard worked just fine without pressing ^Q ! But if
I have used during debug printf or similar, and press
^S, the keyboard doesn't work untill I press ^Q again.
     I hope this helps!

Arto J.

Let me first say that I know NOTHING about the atari computers. I am strictly an

I.B.M. clone person. But -- A friend of mine has an old 8 bit atari computer which
he has long since lost the manuals for. He has several programs that he wrote
years ago in Atari basic. He cannot remember the command used to save
them to disk. Can anyone help or even better point me to some software
help files?

Nope, nothing which matches the wonderful GUI-building tools that
VB is so famous for. They -are- fun to use, aren't they?

Then again, I personally think the VB language itself is atrocious
and VB's pseudocompiler an evil plot from the bowels of MicroSloth,
but that's another story.

Just think how productive Windoze programmers could be if they had
the syntax and speed of GFA for Windows and VB's GUI tools. ;-)

I am using nice clean, MultiTOS, 100 1.112538e-308gal GEM calls. And printf for
debugging. Damn. I think that's what the problem was but I haven't had a
chance to check yet. I let you all know.

|> How does one invoke and call the Falcon toolbar?
|>

I assume you mean having a widget bar at the top of a window. The falcon
has a special function to do this, but it's better to use one of
the many GUI libraries that provide this sort of thing (DULIB provides
a function to attatch a widget bar to a window, as does EGEM) as this
lets your programs run on all TOS versions, rather than just a falcon.

If you really want to use the f030 specific version, check out the Atari
Compendium for details....

Craig.

Hi!

The behaviour you described is OK, because with normal buttons, you always have to click-release to select them. Set the TOUCHEXIT-flag for these buttons, then it should work.

Ciao

Thomas

Yes, that's because Fread returns '0' and leaves the buffer empty if you just
press return. Older GEMDOS-versions always put the cr into the buffer and
returned it as being read. I don't know how TOS 4.02 and 4.04 behave, but if
there's need, I'll write a patch for that (it affects _all_ ST-Pascal+-
compiled programs and some other which rely on that Fread-behaviour).

Ciao

That _is_ certainly normal behaviour for the XON/XOFF (^Q/^S) keys. Using any
the BIOS or GEMDOS I/O routines (except RAW) enables XON/XOFF interpretation.

Yes, that's what its been. In the last few programs I've written I have
placed a small debugging line under the menu bar in development versions,
using printf, and that was switching on XON/XOFF sensing.
Thanks to all who helped.

There is a description of the file format (and many others) in:
 <URL:ftp://src.doc.ic.ac.uk/packages/atari/umich/Graphics/picfmts.doc.gz>
If you leave off the .gz, the FTP server will gunzip the file before
sending it. The .PC1 format is low resolution DEGAS Elite Compressed
and there is nothing dodgy about it.

That is because you are trying to access the system rom at $E00004 (STE)
the addresses at $0 to $7 are mapped to the EPROM address.

STOS is a games-oriented programming language based on BASIC, with lots of high level facilities for moving sprites and blocks of screen memory about. It's a little slow, but it's great fun and easy to program, and being a (compilable) interpreted language, it's extremely easy to debug.

According to Roger Sheppard, I think it's...

  "Snot-nosed Teenage Operating System"

:)

But actually, it is a commercial Atari ST BASIC programming language

that came with special tools and commands for graphics, game design, etc, etc. I'm not a big fan of STOS because I found the language implementation itself (repleat with line numbers, no less) to be pretty archaic)IMHO) but it did have some spiffy tools for making games, using sprites, sound and music, etc, etc.

No longer being developed or supported, AFAIK. But you can surely find copies of it forsale if you shop around.

Maxon used to sell Application Construction Set - there's a demo kicking around
somewhere. It's a bit lame compared to VB for Windows or VXP for Motif, and
I don't know if they continued development....

I think someone should get round to one for C at least, based round one of the
many GUI libraries that support Callbacks - although a Basic one could be
done for the HiSoft compiler as there are a couple of GUI libraries that
support callbacks on that as well.

Maybe the next version of Interface will expand into a code generator as well?
(conjecture)

Neochrome Master was based on the original NeoChrome, but hacked by a demo crew (I forget which one) and expanded to be much better than the original. Unfortunately, I think they used the comercial version as the codebase, so Atari got a bit stressed over it.

A shame really, as Neo was a great package when it was first released and if it had recieved a proper on going development effort it would have kicked ass by now.....

NeoChrome was, until a few years back, commonplace in every PD library. The rights, however, were still held by Atari and it had never been released into the public domain, meaning all the copies people had ordered by PD or downloaded

were illegal. Eventually, Atari asserted their rights, and it was deleted from every BBS and taken out of the PD catalogues, and the only place you could get it from was either direct from Atari itself, or bundled with an ST.

NeoChrome wasn't the only program that followed this path - Joust for the ST was never PD, despite being in most PD catalogues, as well as a few other bits and peices I can't remember right now...

Can someone help me to find a good DSP assembler? I've tried QDSP_ASM which is good but has a number of bugs, (namely, jumping to '*' doesn't decrement the PC by one). I tried to compile the GCC-56K with little success. If anyone has managed to set-up a good PD DSP programming system, please get in touch with me.

Thanks in advance.

STOS is a version of BASIC, that provides lots of routines to make writing games easier (ie sprite commands, music etc).

The STOS faq can be found at : http://www.cs.man.ac.uk/~jacquesa/stosfaq.html

Hi,

I am coding an extension for STOS to allow the Falcon to be used more fully by the language. I have quite a bit done now (ie True colour graphics

commands etc.). However, I sent a copy to Rich Davey, and one of my commands cause the system to crash.

The command that doesn't work is simply a call to XBIOS 88 (Setmode) with the parameter passed from STOS. For some reason, when this is executed (only on Rich's system - not on mine), it changes video mode, but then causes a bus error (IIRC).

Anyone got any ideas why this is? - it doesn't happen on my Falcon.

Rich is using a TOS 4.02 Falcon, with VGA. (No auto/accs loaded.)

Cheers

Anthony

Buy DevpacDSP from HiSoft - it's quite cheap and pretty good.

Craig.

German Pure Pascal is excellent (I don't know, if they've bothered to translate the thing in English..). It's simply great. And fully PC Turbo

Pascal 6 -compatible. It's fast, produces good code, and easy to use. And even better: you can get a Visual Basic -like (in a way..) extension called "Application Construction Set", or ACS Pro. That makes it easy to create great GEM-programs graphically, in a modular way. There's even a Pure Profiler available for their Pascal and C-compilers.

Maybe someone can give the address where this thing is sold?

Cheers,
TH

Btw, the German language doesn't make it impossible to use at all, if you know something about Pascal already. For a beginner, it may cause headache..

Simple question.

How do I read the joystick ports from assembly language?

I'd like a response that covered all STs, STEs, MEGAs and Falcons if possible.

I presume it's just a MOVE.W instruction, but what's the address I require? I hope it's the same for all the Atari range 'cos I don't know a thing about the cookie jar and stuff.

Please send me an e-mail, because our news server is erratic to say the least.

Thanks for your help,

Ozzy.

look at WWW page :
http://www.dtek.chalmer.se/~d2cg/qa/a1.html

there is no ports to read the joystick. (it can be obtain by one of the keyboard's messages)

the xbios call Kbdvbas() gives you the adress of a table of vectors (keyboard and midi).
There are two words or bytes after this table where you can get the joystick value.
(I think it's approximatively Kbdvbas()+50)
if you're not in the joystick mode, you can read the joystick button state in the right
mouse button.

you can also create your personnal routine as described in the www page.

you can get Enhanced GEM (EGEM) by Christian Grunenberg
from ftp.uni-stuttgart.de in pub/systems/atari/programming/C

You will find
- egem_220.lzh _Complete_ sources
- e_gemut2.lzh some utilities
and
- egemd220.lzh Demos to show you the capability of egem.

Have fun !

This is an announcement for a new package for the Atari range of computers called OASIS.

As of Tuesday 18/4/95 I have upload OASIS100.ZIP to the following sites

DEMON ftp.demon.co.uk

Posted to the incoming folder in the Atari section of their FTP site

HENSA micros.hensa.ac.uk

Posted in the incoming/atari-tos folder in the incoming area of their FTP site

Chameloen BBS (UK 01454-831095)

Uploaded to the Comms area of the bulletin board

OASIS is a GEM based off-line reader replacing the complete set of AtariNos off-line utilities, the only items retained are the NOS on-line software and the DEMON.TOS batch file launcher.

There will is no shareware policy on version 1.xx of OASIS, just E-Mail me if you use it. Comments, likes/dislikes, wish lists for further features and Bug reports, if any :-), would all be appreciated

I have been using the GEMFAST library that comes with Heat & Serve

C, to write some simple programs. However I cannot get the windows
to work when using MiNT. They all work fine under TOS but not
under MiNT. The same can be said for the DEMO programs supplied.

To all who are trying Oasis.

We are sorry for the troubles that people are experiencing :-(

Unfortunately we have two acts of God and on of BT acting against us, Phil's TT blew its power supply, A hard disk corruption, My own phoneline has been useless for a modem for just over two weeks and various last ditch attempts at getting Oasis out in the last week drained us.

Even when we finally got it out we stupidly left a line of code used in running the test version so Oasis100 becone Oasis101.

Now its out we find that the ST Medium Res resource has corrupted and various extremely minor bugs that appeared in beta test, which we put to bed ages ago are re-appearing.

Enough of this snivelling.

Please give us 2 days and correct these errors and we will upload Oasis102 which we will make sure is as bug free as we can get it.

Again we apologise to any who have had trouble - if you aren't having troubles please still upload the Oasis102 version.

Sorry again, Dave

Posting-number: Volume 1, Issue
Archive-name: joyread

[Lots of STers seem to have trouble reading the joystick ports, which is much
 more painful on the ST than on the 8-bit. These routines should help make
 it easier. Note that these are just some routines, and not a complete

program. -sg]

```
/*-----------------------------------------------------------------------
| Stick.c:  Joystick interupt service routine
|
| Placed in the public domain March 1988 by Greg Anderson.
|
|      The joystick demo by Steve Jankowski was instrumental to
|                  the creation of these routines.
|
|   Many thanks to Steven Grimm for providing essential information
|               and the aforementioned joystick demo.
|
|#######################################################################
| THESE ROUTINES ONLY WORK UNDER LASER C!  THEY MUST BE MODIFIED FOR
| OTHER C COMPILERS, _INCLUDING_ MEGAMAX C VERSION 1.xx!
|
| MegaMax instructions:  A4 must be saved somewhere so that it is
|     available durring the isr.  Then, the isr can access joyinf
|     with "lea joyinf(A4),A1" instead of "lea joyinf,A1".
|#######################################################################
|
|     This package sets up an interupt to read the joystick on the
| ST.  The joystick is read via the ikbd--the intelligent keyboard
| interface chip.  The ikbd can be placed into "joystick-reading
| mode" by sending an appropriate command with Ikbdws().  This has
| two effects:  first, the mouse is disabled.  Second, the ikbd will
| be prompted to send a three-byte packet every time one of the
| joysticks changes states.  The packet is as follows:
|
|     [Stick #]  [State of Stick 0]  [State of Stick 1]
|
|     The first byte is $FE if stick 0 changed, or $FF if stick 1
| changed.  These routines ignore the first byte.
|     The next two bytes contain the states of sticks 0 and 1.
| There values will be the sum of:
|
|                  +1    (+128)
|                   |
|            +4 ---< >--- +8
|                   |
|                  +2
|
|     Add the apropriate value if the contact is down.  For example,
| if stick 0 is NW and the trigger has not been pressed, its
| current state will be 1 + 4 = 5.
|
|     These packets are sent to a routine pointed to by "joyvec".
| Joyvec is part of the structure returned by Kbdvbase().  Joyvec
| can be changed to point to an interupt service routine (isr) of
| our devising.  If this is done, the isr will find that A0 points
| to the first byte of the the packet sent by the ikbd.  The isr
| must be very short (less than 1ms exicution time).  Atari's docs
```

```
| of Kbdvbase indicate that a copy of the pointer to the packet is
| also deposited on the stack; however, this does not appear to be
| the case.
|
| Using these routines:
|
| Call stick_init() to set up the joystick isr and place the ikbd
|    into joystick send mode.  This will also disable the mouse.
|
| stick_exit() will return the ikbd to mouse send mode.  Your
|    program should do this before exiting.
|
|    Once the initialize routine has been called, the following
| commands are available:
|
| _stick(n):  Return the state of stick N.  (See above chart)
| stick(n) :  Return the direction of stick N.  (Minus the trigger)
| trig(n)  :  Return the state of the trigger on stick N.
| hstick(n):  Return the horizontal position of stick N.  (-1 to +1)
| vstick(n):  Return the vertical position of stick N.

Sounds deadly.

DL>   Even when we finally got it out we stupidly left a line of code
DL> used in
DL> running the test version so Oasis100 becone Oasis101.

Been there myself this week.

DL>   Please give us 2 days and correct these errors and we will upload
DL> Oasis102 which we will make sure is as bug free as we can get it.

Dave, will these fixes include the errors in the install program, and
provision for 9 digit passwords?

Daron - dbrewood@nest.demon.co.uk

Anyone knows the scheme used by Hensa in grouping the files?
The m, n, o, p & q directory structure sure looks like no correlation between
types of file... or is there?

Yes!

You can order a set of 7 diskettes from TAF's Library which installs
a MINT / X-Windows / PPP / Chimera / FTP / Telnet. All these PD
systems were written by various Atari People (who we thanks).

Sam Mesbah, put them all together and created an installation procedure.
(It's my understand he will be putting this at an FTP site also! Either
Sam or I will let you know where).

Here is how to order it from the TAF library:
Send $25 Cdn Dollars to:
Toronto Atari Federation
5334 Yonge St, Suite 1527
Willowdale, ON, Canada
M2N 6M2

I will add more information on the TAF home page later this week:
http://www.io.org/~schrist/taf.html

Here are some important notes!!

Requirements:
(0) 14.4 Modem (Min) (Highly recommended) - Appropriate Modem RTS/CTS patch
(1) 4M Machine (Min)
(2) 10M (Min) separate Hard Disk Partion
(3) An Internet Service Provider with PPP - SLIP acceptable but untested.
(4) Mono Graphics mode (ST High, Falcon, TT High)
(5) ST-ZIP, TOS/GEM based text-editor (knowledge of a UNIX, VI editor will make
    your life easier but is not essential)
(6) A Boot manager makes your life easier (SuberBoot, XBoot, etc.)

Also, check out Gem++ if you want to do C++ programming (I guess GNU is currently the only compiler which supports this on the Atari, but it's used a lot for MiNT/X - ish type stuff. It's also on atari.archive as gem++19.zoo in the Programming directory. This is by Warwick Allison and was used for GEM Nethack, for example (cool game!).

Does anyone jbow of a PD c compiler which will allow windows etc
to be created and run, on a Falcon 030 using MiNT 1.12?

I have usewd Heat 'N Serve C, with Gemfast, one the programs
are compiled they very rarely run. Indeed manny simply
crash the machine. Creating windows seems to be the main cause.

Rod

Not in my experience. I have two Conner 540MB drives on my Falcon's SCSI port,
and I get over 1MB/s reading throughput. Don't remember the exact figure
for writing, but it isn't much worse.

I'm trying to intercept ^C with "signal(SIGINT,handler)", but my interrupt
handler only gets called under MiNT. TOS even blithely ignores SIG_IGN.
Is there any way I can get the same binary to work under both MiNT and TOS?
(TOS appears to be intercepting ^C itself when I'm writing to stdout.)

Stephen

Is this group dead? Are there no more atari programmers? This wouldn't
surprise me of course, but I am curious anyway. This group started as a
very active group, now I get about 3 postings a day! I started programming
on my 486 linux box a couple of months ago, I guess we all did. But I
kept programming my ST.

Hi everybody on the net and on ATARI...

Since I got X11R5 for MiNT, I was very pleased to play with it.
But the problem is that you can't run GEM programs under X11. Would it be such difficult to add GEM features to an X server ?
I think it is possible to made GEM running X application in a

GEM window. It would be easy to use because it will use VDI for screen output. You'll have compatibility with all video modes availa ble under GEM. This will be the huge version (it needs no integrate X protocols under GEM, or would it be better to integrade GEM (AES) in a X server ?). The little version could be X server only (so you could run any X apps on a Atari, like I do it at this time on a PC used as an X terminal).

I call it MiXT because it would mean MiXT is X and TOS. I hear that Atari software get smaller and smaller (in number). As Internet become more and more popular in our computerized years, it would be good to have an easy-to-use-in-a-networked-environnement interface. We all know that GEM is very simple for such an interface, but it lacks of portability. Why couldn't it be possible to make an XGem.h library ? There is Motif like and Open Look like windows under X. We (all Atari programmers) could mix our capabilities in such a wide project.

X Window is standard on Unix boxes, and it surprises me that nor IBM (in OS/2) neither Microsoft(in Win95 and WinNT) have integra- ted X in their software. Even if X requires lots of power, the availabi lity of Atari German clones shows me that we could use this power in a great way. The Medusa or the Eagle could become real workstations (with MiXT (MiNT-Unix like) and could run GEM applications as always.

I'm waiting your reaction, netters! If you think there's nothing more to code on Atari, you don't need to reply me.

newsgroups: comp.sys.atari.programmer

I need quite desperately to be able to detect where two bezier curves cross one another. I know this is possible as I've used programs that must have performed this task to give certain results.

I do have a crude method that I have developed, but its way too slow and processor demanding. There must somewhere be a quick formula method; I hope.

For those of you that don't know and are intrested a Bezier curve consists of two control points and two anchor points. They are used to generate EPS-type graphics and in CAD programs.

This is a rough diagram where X are the anchor points which the dotted line runs smoothly between, and the Q's are the control points, which determine the angle and strenght of the curve.

```
X                   X
|.                 .|
| .               . |
|  .             .  |
|    .         .    |
Q       .  .  .      Q
```

BTW. It is phycially possible for two bezier curves to cross one another up to nine times, as they can be shaped into a Z shape.

Thanks in advance for any help news/email I may recieve.

I have heard, some people are already working on this. I forgot who
but I have heard some one was writing a library for X that enables
you to recompile GEM applications for X.

Maybe Annius knows more about this, he ported his editor Edith to
X (is it finished yet, Annius?).

I personally prefer C. It's quicker to write and easier to debug, you
loose very little speed with a good optimising compiler and you can
link in assembler routines for the time-critical bits, interrupt
handlers and the like.

But I'm sure there must be advantages for coding directly in
assembler. Can anyone tell me what they are? ;-)

: >Talking of no programmers here, are there any Assembler programmers out
: >there? I think I've seen a couple of Coders out here, but not much goes
: >on. Anybody want to join forces and write a game or something?

I wrote a game on Falcon some nine months ago (called Switch - you know about it?), and I didn't make a darn line of code since, mostly because I had to sell my Falcon. It was really fun, but I don't know if I'm ready for this kind of adventure again right now :)

: But I'm sure there must be advantages for coding directly in
: assembler. Can anyone tell me what they are? ;-)

Having fun :) Well, I personally think that ASM-coding is good when you need light-speed routines or when you want to make demos and games. When it comes to "professional/serious" stuff, I think that object languages have more advantages, mostly for program clarity and debugging facilities.

Feel free to email me for any questions. Cheers :)

Yes. But I tend to leave that to work where we use Sparc stations. PC's are adequate (Assuming a pentium with SCO Unix or something) but do not really match up to a dedicated workstation in any way, shape or form.

I probably did not express myself very well here. What I meant by 'everything about the AES and VDI' is at the system call level. There is a lot of knowledge out there above this level (in the form of AES libraries, WinX, etc) this must be true since products like Geneva and MagiC could never be produced without it. The fact of the matter, as I see it, is that this sort of knowledge is not shared and is probably not likely to be.

If this attitude existed in the PC world, there wouldn't be the myriad of books available in Windows programming. What we as Atari programmers need is the sort of development tools and knowledge sharing that exists on the PC and Macintosh. Alas, I think it is far too late for this to happen.

SysGem, Enhanced GEM, Magic (!= MagiC, Mag!X).
EGEM is freeware and the whole sourcecode is distributed.

SysGem is shareware (round about 40 DM) and is my absolutly favorite 'cause
it's so easy to use. I'm not sure if there's an existing english version
of SysGem.

>I'd be grateful if anyone knows of a library that I can get from an FTP site.

Urgs, that's a problem. I think all the libs are available via FTP, but I
don't know where you can get them, sorry.

Thanks Russ, but don't look at me (I think you're biased)! There's plenty of much better Atari programmers out there than me. I have to program on a VAX :-{

I think this group is quite healthy. I don't agree that the people who know like to 'hide' it. Just stick a question in this group and you'll probably get lots of answers within days.

no no no no! I have worked with sparc stations for the last 4 years now, and
my linux box at home (486DX2/66 + 12Mb ram) beats my sparc IPC+16Mb RAM+Solaris
2.4. Now I have a SunSparc5 and this is faster than my linux box, but
only because Solaris 2.4 is so damned big and my SS5 has 32Mb RAM.
It is bull that sparcs are better workstations than PC's! I know some
other people at the physics department of another university, that
are considering not buying workstations anymore, but 486's or pentiums
running linux instead, because the performance is the same, but they cost
only a third of workstation. Times are changing: the pc's are entering
the market of workstations.

so check your facts first, next time.

:>lets delete group then.

HSC is beginning to show its age, I think. Most likely the GEMfast library that comes with it is either not MiNT-compatible or not Falcon-compatible, simply because it predates both.

I would suggest upgrading to at least SozobonX, another descendant of the original Sozobon C compiler that spawned HSC. It has an updated version of the GEMfast library that is much more likely to be MiNT- and Falcon-compatible (and if it isn't, there's an active maintainer you can complain to, unlike HSC). There's also a SozobonX port of the MiNTlibs, to aid with MiNT compatibility.

SozobonX is available at ftp.fu-berlin.de:/pub/atari/programming/sozobon; the MiNTlibs are available from atari.archive and mirrors under Mint/Lib.

Well, if you like speed, assembler is your language... But apart from that, the
main reason that I program in assembler is that I don't know any C ;-) I tried
to learn it a couple of years back, but I couldn't get to grips with it.
I'll try and find a C course to do this summer...

I believe the Gnu C/C++ compiler should do the job. You certainly have enough RAM to run it (2MB required) and it does come with AES and VDI libraries. There is also a MiNT specific version but I have not used this.

Checkout src.doc.ic.ac.uk in /packages/atari/umich for the latest versions.

I did get my start programming on the Atari 8 bits (400, 800, 1200XL, 130XE) and I hold those days in fond regard.

However, I will NOT step foot inside comp.sys.atari.8bit again until the software pirates have been 'kicked out' by the other, more responsible readers of the newsgroup.

I don't care to read a newsgroup where every other message has to do with the latest 'warez.' I realize that such yobbos will always exist, but you don't have to tolerate them. At least I won't.

: I'm waiting your reaction, netters! If you think there's nothing
: more to code on Atari, you don't need to reply me.

Well Patrice,

This sounds a very good idea - but does even a Falcon have enough
power to cope with it?

If MiNT + X11 work OK and GEM works OK then why not boot up in whatever configuration you need for your present task?

Sure Things like MacMagic + System 7 on the Mac for one and OS2 on the PC work fine but how much memory do they require? How much memory does the average ST owner have? You will definately need more than the standard 4MB.

On the other hand, writing a GEM emulator to run under X would not only (I Feel) be easier, it could also be portable to other Unix or Linux based systems, and most X systems are running Virtual Memory which gets round the memory problem.

There is a MS Windows emulator for PC Linux so I don't see any reason why GEM cannot be ported to Linux also. It shouldn't be too difficult at all - wasn't GEM written in C to start off with?

I am soon to put Linux onto my STFM + PAK/3 and if I get that to work I may try such a hack...

If you feel able then have a go at it - and if it works you may be able to sell it to all those Linux using PC owners (Most of which I know say that GEM is much better than MS Windows!)

Beric..

: I use Lattice and TOS 2.05 and tested this fragment:

```
:    #include <osbind.h>
:    #include <stdio.h>

:    if(!Bcostat(0)) puts("Printer is offline!");
```

: That worked with a Star Lc 10.

: Are you sure your printer is online? (Maybe a stupid question but you
: could be out of paper or something..)

: There is another call: StatusOK = Cprnos() /* test printer output */
: Returns nonzero if "there is room for at least one more character".

: AND (This may be it!) gemdos calls *only* work when you "default to short
: integers" (or typecast)

: /Jens M. Andreasen

It works fine on my Falcon. However I use GfA Basic and the command for checking the printer is:

```
var=Inp?(device)
```

Returns 0 if not available and -1 if available for printing. So:

```
Status!=Inp?(0)
```

works great.

I would assume that GfA uses the Bios call for checking printer status.

The Atari Compendium gives Bcostat() as the call (Bios 8) on page 3.29.

I have tried both approaches and found they work fine on my Falcon with TOS 4.04. However, sending data to the printer via GEMDOS does not seem to work. I must always use the BIOS call Bconout().

Oh well...

Rich

No, you can only link c code with assembler.

Well there is nothing to stop trap handlers from switching to user mode
once the time critical bits have been done.

I find HiSoft's current attitude to new releases rather disheartening. Compared with what SAS have done on the Amiga (remember, SAS C & HiSoft/Lattice C were both derived from the same original Lattice 68K compiler) HiSoft have been very lax in thier product support. SAS is now a full C++ compiler, and costs around the same as Lattice, whereas HiSoft haven't really improved the compiler from v5.5 (which I bought for 40.00 last summer, a real bargain) to 5.6 - basicly they just added a few new libraries & some extra controls in WERCS - but didn't support colour icons, which I see as a real short coming in a system billed as providing full support for the newer systems.

In short, I'm glad I didn't pay full whack for it.....

Craig.

No, there is no such thing.

All you can do is write complete functions in assembler and link them
to the compiled object-files. The specification for variables
is described in the assembler-handbook (in the german version of PureC)
I guess it's something like the first three numbers (char, int, long)
are put in D0/D1/D2, similary the first two adresses in A0/A1. The
rest of the parameters and all double-parameters (if fpu-code (-8)
is UNset) are put on the stack (reverse order, as usual in C).
You are not allowed to change all registers, but I don't remember
which register have to be saved (I'm quite sure, D0-D2, A0/A1 may be changed).
D0 or A0 is used for the return-value (if it is no double...).

There is an assembler in the PureC-package (pasm.ttp or part of the
integrated version (?)) and it should be no problem to include
assembler-sources (*.S) in project-files

: Hi,
:
: Watching the strange color flickerings on my Falcon scrolling text
: in a window in 16 color mode, I got an idea for an *extremely* dirty
: solution to both speed up the scrolling with a factor 4 *and* loose
: the annoying flickering. It assumes you're using black-on-white text,
: with white being color 0 and black color 1 (but in fact will work if
: `white' and `black' differ in only one bit of the register). Since
: the bitplanes are stored separately, what if you'd just ignore planes
: 1-3 and only scroll plane 0? That would save a factor 4, even a
: factor 8 in 256-color mode.

No. There is no guarantee that vdi-color 1 (black) is realized as
a 1 in the bitplanes.
I don't know about the Falcon but in ST-Low black is VDI-Color 1 but
15 (all 4 bits set) in the video-mem.
Don't ask me why.
(It's one of the worst things, since you can't say, in which way
VDI and Hardware-color numbers are connected (exepct you test it
on the screen...)

: But, alas, I rejoiced too early. The bitplanes are `interleaved'
: which renders my plan almost useless. How exactly are the bitplanes
: stored in memory? Interleaved in words/longwords? Can I save time
: only scrolling the first byte from groups of four, or would that even
: be slower? What about the 16 bit bus? I guess I could only reduce
: the flickering...

Don't do such things.
Not using the VDI means your programm will run on one hardware.
That's the way TOS-software was built in 1985 but I think that's

quite some time ago...

With the impending release of patchlevel 46 of the MiNTlibs, I'm faced with something of a dilemma. I am now, or will soon be, maintaining MiNTlibs ports for three separate compilers, one of which I haven't used in years. As you can probably guess from the title, I'm referring here to Ian Lepore's Heat-n-Serve C compiler. I'm not entirely sure I even have all the compiler parts of HSC any longer, and the prospect of reconstructing this rather antiquated compiler just to rebuild the MiNTlibs for it quite frankly gives me the screaming heebie-jeebies, you know what I mean?[*]

And so I come before the `net to ask: Is there anyone out there who still uses HSC and the HSC MiNTlibs? If so, can I possibly persuade you to switch to SozobonX? ;) Or better yet, c68 --- full ANSI, function prototypes, long- and short-int modes, what more could you ask for? ;)

Basically, if you really want to see patchlevel 46 of the HSC MiNTlibs, drop me a line. If I don't receive any requests, I will be dropping HSC support. If you're interested in taking over support of the HSC MiNTlibs, I'd be most grateful. ;)

Anyone out there using Lattice 5.6 doing a large number of
mallocs successfully? I'm having some serious bugs and would like to
discuss them with anyone who's having sucess. I running around 20-25
mallocs with buffers going up to 2 megs. Anyone help would be greatly
appreciated.

Thanks,

The deadline for the YAC Freely Distributable Software Contest is almost upon us. In case anybody missed the original announcement, I am posting it again. If you have any questions, please e-mail me. I need to have any contest entries in-hand by Friday. As there could be problems un-encoding mailed files (I've had some problems in the past), I recommend early submissions.

-------8<----------8<---------

YAC SHAREWARE PROGRAMMING CONTEST

Shareware Programmers: Would $50 help inspire you to finish that program you started over the summer but never finished? What if we could help you distribute your software to local BBS's, the major on-line services, the Internet, and at SAC Expo? We could also help you by writing and printing documentation to go with your program (we can translate from German to English if necessary). We'll even throw in a years membership to our local user-group: with its monthly newsletter mailed directly to you, and the honorary title of YAC Official Programmer for a year...

THE YOLO ATARI CLUB IS HAVING ITS ANNUAL SHAREWARE PROGRAMMING CONTEST.

Entries must be TOS programs new for 1995 and must be received by March 17th, 1995. They will be judged based on originality, compatibility (remember, there are all these new multi-tasking solutions and Falcon resolutions to try and respect), efficiency, and dependability.

Entry is simple, just mail your entry to the Yolo Atari Club at 1129 Fordham Drive / Davis, CA 95616 / USA. Or e-mail us an FTP-able location where your program resides (remember to include your program's

name and the full path to it), although give us an extra week if you plan to do this so we can be sure to have time to download it. We can be reached at elhays@ucdavis.edu. Remember to give us a way to contact you. The winner will be notified by the end of March and then announced on-line and at the Sacramento Atari Computer Exposition, April 22nd, 1995.

Entry is free (or the cost of a single letter), and could earn you $50, fame, and glory. So why not give it a try?

With big partitions under Minix you might need an XHDI compatible hard disk driver like HuSHI or HDDRIVER. There is some information about this in the MiNT documentation. Didn't you read this yet?

I am have succeded in opening an offscreen bitmap using NVDI3 &
memory.sys, but can only open a bitmap *and* allocating memory for it at
the same time. This is not what I want, I need to open the offscreen
bitmap to an existing bitmap in memory (several, in fact, but not at the
same time...). How do I do this?????

Also, I understand EdVI (subset of NVDI) have better support for
offscreen bitmaps, but have not been able to make this work. If anyone
has GFA source dealing with this, I would be *very* grateful! As I can
code bindings to the VDI in GFA, other language examples will also be
helpful.

Here are a few AES opcodes to get you started:

```
   10 - appl_init
   19 - appl_exit

   50 - form_do
   51 - form_dial
   52 - form_alert

   70 - graf_rubberbox
   71 - graf_dragbox
   73 - graf_growbox
   74 - graf_shrinkbox

   90 - fsel_input
   91 - fsel_exinput

  101 - wind_open
  102 - wind_close
```

If there are other functions you need, make a specific request and I'll

try to help.

Hi, I am currently writing a game in GFA basic and I would like to put a
Quartet song at the begining of it. With Quartet you get a GFA listing to
allow you to load up and play songs, but it doesn't allow you to select the STE
output which makes it sound a lot better (pressing one of the F keys during
quartet itself selects the STE output), what I would like to know is how do I
select the STE output using GFA and the quartet file provided. If anyone can
help me I would be most grateful. If anyone can help please could you e-mail
me at this address D.E.Jones@ex.ac.uk. Thanks.

>which renders my plan almost useless. How exactly are the bitplanes
>stored in memory? Interleaved in words/longwords? Can I save time

Okay, this is how I've always thought bitplanes work.... (I may be wrong!)

A Byte in memory contains ONE bitplane, hence it covers eight pixels.
In 16-colour mode, four such bitplanes are needed to give the four bits
needed to get 16 colours, and they are arranged like this:

```
      BP 1     BP 2     BP 3     BP 4
    10101010 10101010 10101010 10101010
    |        |        |        |
    |        |        |        |
    1        1        1        1  = 1111 is value of the pixel
```

So the first four bytes in memory refer to the first eight pixels, the next
four bytes refer to the next eight pixels, and so on...

Similarly, 256-colour mode is interleaved, but it has eight bitplanes....

True Colour mode, BTW, is completely different - it is known as a 'chunky'
screen.. Each WORD in TC mode refers to one pixel, and it's bits are arranged
as follows:

```
    True Colour Pixel
    RRRRRGGGGGGBBBBB   -  5 bits Red, 6 bits Green, & 5 bits Blue
```

Hope this helps,

Neil.

Right, except that ST low- and medium resolutions work in chunks of 16
bits, not 8 bits!

The first four *words* describe the first sixteen pixels, etc. in
low-resolution.

I may not be the right person to reply on this one since I've never heard
of "GBELL". Can you tell me more?

Nevermind; AES calls deals with <events> & <windows> & <multitasking>.

Usually you would call AES by name and not by number. Allthough I do have a
list of all of the numbers/names, it's a bit on the large size for retyping
all of it. If there is some function you need to call by number then I
can check it for you..

Well then you will have to put the parameters manually in the right
places and call bios yourself (and sell the correct routine to HiSoft :-)
I'll try to figure out the adresses if you need'em (tomorrow..)

Allthough I can't help being a bit puzzled. Is it the same situation if you
use Backwards or dis/enable multitasking? The parameters and traps *should*
be identical for all OS versions (???). It's kind of hardwired to the
Motorola filosofi.

> This plays the sample correctly, but does not stop at the end of the
> sample. What am I missing? The same thing happens with record....
> BTW this is all in assembler, not C....

If it plays it correctly this may not be it but the last 0 (zero) to devconnect
enables the handshake. You shouldn't use handshake when playing samples, only
when you want to control the flow of the data.

Tomas :)

I've written a program that allows the user to define a box on thne screen,
then the program 'zooms' in on that box. The problem is that the top
character line (where the menu bar would be) is innaccessable. Anyone know
how to cure this?

ATB
Keith

Hi!
I have a problem:
I want the timer-A to be executed AFTER playing or recording a buffer
(This is only a test, my real program makes more sense.)
First, the soundsystem is initiated, then a buffer is cleaned, to
see if something was recorded and aufnahme1() or aufnahme2() is executed
to start recording. In the interrupt, the variable laufe is cleared.
After calling aufnahme1/2() the program goes into a while-loop.
Here the variable laufe can also be cleared by pressing a key.
The interrupt is never called, often the system crashes.
Who can help me ?

  Torsten Mohr

Does anyone know of SLIP software that is available for Atari? Also, is there FirstClass software, or a reasonably good clone of FirstClass, available for the Atari? If anyone knows, please E-mail me. I don't care if you post the answer here as well, just as long as you E-mail me.

Also, please excuse the weird cross-posting. I just wanted to reach as many people as possible who might know.

Thanks in advance,

Pete

Does someone know of a programm or utility to convert CGM-graphics file into GEM-Metafiles and viceversa, or a source (preferable C or Fortran) to read CGM-files.
And a program to convert CGM-Graphics in pure raster monochrome (300dpi or between 1000*1000pixel and 3000*3000pixel).

The programm can be running under (in order of preference)
ATARI-TOS
or
VAX-VMS
or
UNIX
or
MS-DOS/WINDOWS

If possible send me answer by E-mail to
holfort@bnlcl6.bnl.gov

Thanks JH

>a 1 in the bitplanes.

There is a standard mapping from VDI to Hardware pallete colours, although I've only seen this documented for 4 & 16 Colour modes, I assume the same holds true for a 256 colour mode as well.

>I don't know about the Falcon but in ST-Low black is VDI-Color 1 but

>Don't ask me why.
>(It's one of the worst things, since you can't say, in which way
>VDI and Hardware-color numbers are connected (exepct you test it
>on the screen...)

See above - the first time I saw this documented was in 1986 in ST-World.

>Don't do such things.
>Not using the VDI means your programm will run on one hardware.

Actually, there is no real reason why he cann't do this if he wants a blindingly fast editor. I beleive that Tempus does some similar tricks (and worse) to get it's speed. If written well (ie. using vq_extnd() to get the full display infos) the program should work ok on all direct addressed screen modes. Ok, it'll be no use on a gfx card, but then, you shouldn't need it with a gfx card anyway, as they tend to have their own processor to do the shifting about anyway (well, Matrix cards do anyway). for St-Low -> f030 256, just shifting one bitplane would work fine, and due to the 16 bit interleave, would probably give a useful improvement in speed. If he's clever with the window placements (ensure window interior always on 16 pixel boundary) then the technique can be used under GEM instead of going for a full screen (EMACS style) effort.

>That's the way TOS-software was built in 1985 but I think that's
>quite some time ago...

Sometimes you have to hit low levels to get real performance.....it depends what you are aiming for. For myself, I normally try to stick to OS calls, but where they don't give you what you need, you do what you can....how many falcon users use Atari's standard video modes - all the extened screen drivers are hacks, yet no-one has any problems with them. Same goes for

NVDI, WinX & loads of other stuff. Just 'coz it's a hack, it doesn't mean
it cann't be a stable compatible piece of code...it just means the author has
to take more care over it.

I've never come accross c68, so - question....does it compile faster then GCC ?
And how compatible is it (I currently use GCC for MiNT-X11R5 stuff, so I need
MinixFS support, and would have to recompile the MiNT-net stuff for it, as
well as get Andreas to loan me the atari Xlib source to recompile that.

But if memory use is lower & speed is better than GCC it may be worth the effort.
(Note, I already have Lattice, but it doesn't understand MinixFS).

Yes there is, because RTE is a privilieged instruction, the trap handler
won't be able to return if they switch to user mode.

Does anyone know of an HP550C driver for GDOS that works properly in color
(i.e. behaves according to the VDI standards)? The driver in drivers.zip
on a.a.u.e did not print properly, and the driver that comes with
SpeedoGDOS is black and white.

Thanks in advance,

Just switch back to supervisor mode before doing the rte. That way the routines
will spend as much time as possible in user mode.

Regards, Christer.

I would vote for changing the libs to use strict ANSI code all the way
through.

Do you know who is doing the Lattice version, Scott? Reply by email if
you like.

That would be pvt1-117@nada.kth.se, who is identified in the docs only
as Leif.

Hi all!

Is someone using EnhancedGEM 2.20 with GNU CC? I compiled E-GEM under GCC 2.2.2 - I got lot of warnings, but it seems to work. But now I have strange problems (ungultig handle, mysteriously modified RSC). Can anyone share his knowledge?
I would be trying to write a GEMmed Internet client program for MiNTnet - but it requires GNU CC for socketlib. E-GEM is needed to spare me writing all this dialog stuff etc.

Bye Borek

Why bother switching to User mode? Just disable interrupts for critical sections.

Hi,
I'm looking for informations about Gemdos function $14:Maddalt, I tried to get them
by myself, but my old books don't say anything about this new Gemdos function.
Please anyone who knows something about it send me an answer by E-mail.

Xref: nntp.gmd.de comp.sys.atari.st.tech:20114 comp.sys.atari.programmer:551

I'm having some trouble with MiNT and I was wondering if any of you kind people could help me.

Here's basically what I'm doing:

```
fd1 = Fcreate("U:\\PIPE\\TIM", 0);

...

fd2 = Fopen("U:\\PIPE\\TIM", 2);
Fforce(-1, fd2);
```

Now, this should redirect BIOS, which in turn redirects GEMDOS, right?

Well, if I do the above, BIOS gets redirected but not GEMDOS.

If I do this:

```
Fforce(1, fd2);
```

Then GEMDOS (stdout) gets redirected, but BIOS doesn't.

here's my actual code (pardon the debugging stuff):

```
void spawn(void)
{
     int fd;
     char name[30];

     sprintf(name, "U:\\PIPE\\TIM.%hd", numapp);

     printf("spawning... ");

     app[numapp] = Fcreate(name, 0);
     printf("(%hd)", app[numapp]);

     if (Pfork() == 0) {
          fd = Fopen(name, 2);
          printf("[%d]", fd);
          printf("{%d}", (int)Fforce(-1, fd));
```

```
         Bconout(2, 65);
         printf("This is a test!");

/*       Pexec(100, "child.ttp", empty, NULL);*/
         exit(0);
     }

     printf("spawned\n");

     numapp++;
}
```

Note the Bconout(2...) and the printf("This..."). If Fforce is set to -1, the 65 ('A') gets passed through the pipe and the string prints directly to the screen. If Fforce uses 1, the string goes through the pipe and the 'A' gets printed directly to the screen.

All documentation I have (including the MiNT docs themselves) says that -1 should redirect the console for both BIOS and GEMDOS, so why isn't it?????

And on a related note, if I DO get this to work, will what I'm doing there work with the Pexec? Since Pfork actually suspends the parent process, I can't use Pfork and then Pexec(0, ...), so the only thing I could think of was to Pfork so that I could isolate the console from the parent process, and call the child program in the background, and then terminate the parent program's child process. Is there a better way?

Thanks.

Right on the first part, wrong on the second (or rather, incomplete on the second; it does re-direct GEMDOS handle -1, the thing that you get when opening "CON:", but it doesn't redirect stdin (handle 0) or stdout (handle 1). Those you have to redirect explicitly as well. So you need three Fforce calls:

```
Fforce(-1, fd2);
Fforce(0, fd2);
Fforce(1, fd2);
```

to redirect BIOS, GEMDOS stdin, and GEMDOS stdout. (Redirecting GEMDOS handle 2 as well is probably a good idea, since some compilers use this for stderr).

```

```

>And on a related note, if I DO get this to work, will what I'm doing
>there work with the Pexec?

It looks like you really want Pexec mode 200 (replace the current process) rather than mode 100. (Pexec(200,...) is the same as the Unix exec() function.) After the Pexec mode 200 the parent will be able to wake up from Pfork(), since the child's address space will have been replaced with a new one.

Stos-Fix v.3

Can someone e-mail me a copy of this program if they have a copy? It was on a cover disk a couple of months ago. I've looked on FTP sites but can't find it. I'm assuming, of course, that it can be copied to me. I've got very little use for the programs on the current cover disk without it.

I have tried for a couple of hours installing Linux on my Falcon.
It won't work.

I'm using ataboot-0.5, new-filesys and vmlinux-0.9pl5 all ftp:ed from
```

phlem.ph.kcl.ac.uk.

I get it to boot up, installing mouse driver, looking for HD:s,
finding HD:s (IDE 200M + SCSI 1G).
It finds all partition on the HD:s and the Floppy.
Then it hangs in a loop saying:
HD-Controller reset (looped around until I reset the computer)

I run ataboot like this:

ataboot-0.5 -k vmlinux-0.9pl5 -r new-filesys

Conf:
Falcon
4 MB RAM
68030+68882
Both IDE and SCSI drives...
RGB display...

: terminate the parent program's child process. Is there a better way?

    Really? Does that mean page 2.88 of the Atari Compendium ("After a Pfork() call, two versions of one process will exist in memory. Program execution in both processes continue at the point following the call.

...") is incorrect? Gack! And I lost my registration card, so I can't get updates. Does anyone know where I could send, say, my cover so that I could get errata sheets?

Hmm...

Well, I have pretty much established that there is no such thing as First Class client or even a clone for the Atari. So, I'm wondering if there is anyone out there who would be willing to sit down and try to write a program that is compatible with First Class BBS's and operates the way the First Class client does. I don't know how you could do it, but there must be a way.

Thanks in advance,

Pete

Hi,

I'm trying to compile Xrn for Mint-X, everything has now compiled
but when I link it can't find functions re_comp and re_exec which
I assume are from the REGEX package. Anyone know where I might
get sources for these and/or precompiled libraries for gcc?

Thanks,
Sam

Does anyone know the format of the Deluxe Paint font files?
I've hacked around with them for a while now and have managed to extract
the font name, the number of bitplanes it uses and have a rough idea how
the data is stored. But does anyone have a list of offsets or something
they could post here or email me please? I just think its about time
someone wrote a font editor for DPaint, esp. considering how much I use
it myself, so any help would be great. Thanks.

>Well then you will have to put the parameters manually in the right
>places and call bios yourself (and sell the correct routine to HiSoft :-)
;-)) HiSoft have now stopped all support and development for their own Atari
products, including Lattice C!
Mind you, although this was only recently announced, it has effectively been
in force for the past year.

>Allthough I can't help being a bit puzzled.
YOU'RE puzzled? ;-) I lost hair over this ;-))

>Is it the same situation if you use Backwards or dis/enable multitasking?
None of my beta testers have used Backwards AFAIK. I think it's the same
under MTOS.

For the record, I discovered a redirection problem with Lattice C and TOS 4
when the Falcon first came out. If I do:

```
    fp = fopen("CON:", "w");
    fprint(fp, "blah");
```

or use "PRN:" the Falcon crashes at the fprint statement. If fp points to a
disk file, all is OK.

I had to rewrite fopen and fclose to get around the problem. HiSoft blame
Atari although we did find the problem in their libs.

I suspect that my printer problem is associated with this.

```
    if ((strcmp(device, "PRN:") == 0))
    {
        while (!Bcostat(0))       /* fails here */
```

```
        {
            switch (form_alert(1, "[1][PROFILE 2:|
                Printer on parallel port |is not ready. ][ Ready | Quit ]"))
            {
                case 1: break;
                case 2: do_out_flag = 0;
                        return (0);
                default:do_out_flag = 0;
                        return (0);
            }
        }
    }
```

I've tried various forms of this and used Cprnos all to no avail on a Falcon.
Works perfectly well on all other STs, TTs etc...
Even fails on Bcostat(1) for serial port.

I've learned to live with it now ;-))

  I am not that knowledgable on programing - atleast complex languages -
and I was just curious why it would be difficult to write a package of

software for slip/ppp connections. Something like you have with WinSock. Have a ACC that makes the connection and puts you into your account and then once your in the ACC would run in the background keeping you connected and they you would be able to run TTP's that interacted with your connection. If you run under Multi-Tos or Geneva you would be able to have more than one operation running - ie. telnet and ftp. It seems like something that could be ported from the PC realm - I would think.
Thanx,
.\\ike

You need to v_opnbm() to an existing MFDB. Details on doing this (it
does work, I tried it!) are in the docs on EdDI in NVDI 2.5, and are
also in the NVDI 3 programmer's guide (uploaded to micros.hensa.ac.uk
a while ago) although this is in German.

Well, last time I looked at the MiNT source the parent process was
really suspended. This is one of the places MiNT differs from UNIX.
And as such a place to work at with ports...

Gerco.

With Pfork it won't! The parent process will be suspended until the child is completed. With Pexec you can start a child process that will run parallell with the parent. The blocking Pfork call of MiNT is a problem...

OK you guys following this discussion *undelete* the original posting NOW.

As far as I can see your program is failing exactly at the point where
Lattice has to trust TOS... (that means OS is bad?)

On the other hand, you probably saw the message the other day:
>>If you can't do it in C, then do it in GFA (Basic) :-(((means OS is OK?)

I looked up my tables for hardware addresses and wound meself up in a mess
that is (most probably) solved differently on falcons? (We should not
worry bout such "details" anyway!)

Erhm, Did you put ON the flag (option) for "compile for every f___ing pro-
cessor that Motorola ever made" (For the record: Yes it exists)

I'm gonna *pinpoint* your code as soon as possible (but not exactly now),
but I do hope that there still are some other curious C-programmers in this
newsgroup...

"First Class" should really be called "Second Class" since it does not
understand ISO-latin-1, the accepted standard on internet since newyear.

Especially postings from skandinavian Mac users gets extremely corrupted!

IMHO you should support some more intelligent BBS if you have a choice.

There is a part of your code (something like this):

```
     if(strcmp(device,"PRN:"){ /* then do some printing maybe */ }
```

Where do you get the string "PRN:" from? From a shell or cookie or ??
What happens if you comment out that part? Just to make sure that
it's not *device* thats fouling up.

Also Bcostat returns _something_ but what? (Or is it straight connection to
cybernirvana :-)

Does anyone know (or where I can find) the formats to various graphics formats? I am not looking for those like Degas etc, but formats that are capable of any rez. / number of colours (2-256/TC).

I have .TGA (cheers Rich), but this is not suitable for palette based modes...

Respond via email please, as I wont be able to read this Newsgroup for a bit...

Cheers

Anthony

Isn't it so that PRN: and CON: belongs to MiNT? Then how can your code
run on a plain vanilla ST/TT ? (without MiNT)

I don't think it's a good idea to redirect output from inside programmes
using MiNT, there is a warning against this in the mintdocs.

Try and use the files defined in the ANSI <stdio.h> (stdout, stdprt etc).

VDI Team !

In order to write a new VDI we have some persons who will do the job.
But we need more specialists to get ready in time. The project will
start as soon as we have enough people to get ready in time !

The job is well !!! _payed_ !!! and it's used to write a new Atari OS Clone !

Who is needed ?

- C/C++ programmer (C++ preferred !)

- VDI specialists in C and/or assembler (MC 680x0, later PPC)

You are interested ?

So DON'T loose any time and contact me NOW !

Filipe.Martins@unidui.uni-duisburg.de

Please state clearly :

1) I'm interested & capable to do the job in a team !

2) Your Snail Mail adress

3) projects you have done before & what you can do

 (I'm a specialist about e.g.: C++, VDI routines,...)

Best regards, Filipe :)

Everest actually is only a text _editor_, not a real wordprocessor.

If you were looking for a real wordprocessor, I would recommend you
to buy papyrus, if you can afford it. I've been using it since about
one year now and I have to say that I'm very satisfied with it.

papyrus can use Speedo and TrueType fonts via NVDI and Speedo,
TrueType and Postscript fonts via SpeedoGDOS 5.0. So you'd
definately need one of these system programs.

papyrus has a very rich functionality, especially the GOLD version
(very flexible tables with lots of attributes, freely placeable
text boxes with text floating from one box to another, multicolumn
capability, very free text layout (DTP-like!), discontinuous blocks (!),
etc. etc.

And: All of this functionality does not mean at all that papyrus is
difficult to use! I've found it to be very intuitively useable, and
I don't need the user/reference manual very often! This is a feature
which makes it an outstanding product among others.

The new version is 4.0 and should be out in about two weeks
(at least here in Germany). papyrus also is available for OS/2
and runs very stable under MagiCMac.

There is a demo version available, too.

If you should have further detailed questions, just send me an e-mail.

Ciao,

Christoph

From the Holy Book of <3krqkm$807@whitbeck.ncl.ac.uk>
  as spake by Craig Graham <Craig.Graham@ncl.ac.uk> :

>I've never come accross c68 [...]

It's a port of the Minix c68 code generator, combined with some compiler
pieces from SozobonX.

>   [...] so - question....does it compile faster then GCC ?
>And how compatible is it (I currently use GCC for MiNT-X11R5 stuff, so I need
>MinixFS support, and would have to recompile the MiNT-net stuff for it, as
>well as get Andreas to loan me the atari Xlib source to recompile that.
>
>But if memory use is lower & speed is better than GCC it may be worth the effort.
>(Note, I already have Lattice, but it doesn't understand MinixFS).

Let's see, in no particular order:

- MinixFS support: Almost, but not quite. Most of the compiler pieces
  are built with the MiNTlibs and so have no problems, but the linker
  (and assembler, depending on which release of c68 you're using) come
  from SozobonX and are thus linked with its not-very-MiNT-aware
  library. Look for this to change in the near-to-mid future.

- Compatibility is good, if you mean what I think you mean. c68 can reportedly build MiNT 1.12, and I've built the Gnu curses library for c68 with little difficulty. I would anticipate little difficulty in building the MiNTnet portlib or the Xlib for c68.

- Memory usage is good; after all, this is an offshoot of Sozobon, which was designed to be usable from floppies. Of course, the c68 code generator is a bit bigger than Sozobon's hcc, but I believe there are people using c68 on 1meg systems.

- Relative compile speed I can't speak to, as I've never used GCC on the Atari.

Is it possible to start a function in the same adderss
space (the function could use same variables as the main
code) under MiNT? I guess it's possible, but I don't
exactly know how it can be done. Could some MiNT expert
write a C-example how to do it, or atleast tell the principle?

Hi.

Me and a friend are working on a internal clock for the Atari ST(e) and we're thinking of intercepting the systemcalls for setting and getting the system time, and then get/set the time from/to 'our' clock.

This could be done by changing the trapvector to our little routine that checks if the set/get time is called and then executing our set/get time routines. Else just calling the default trap-routine.

Do anyone have some better solutions ?
Pro's and conn's appreciated!

/PO

: I've only seen this documented for 4 & 16 Colour modes, I assume the same
: holds true for a 256 colour mode as well.

What does documented mean here?

Of course there is one specific way this is done in the standard resolutions
of a ST (TT, Falcon), and you can write that down and call it documentation
but AFAIK there is no guarantee that it will be the same scheme for every
possible graphics-card... And to me that means, there is no documentation
how colors are connected...

So in general you cannot say how colors are connected, except you know
exactly about the video-hardware or you figure it out by trying...

I don't know about easy ways to find out the translation table
between the two systems without having in mind a certain videohardware...

: >I don't know about the Falcon but in ST-Low black is VDI-Color 1 but
: >15 (all 4 bits set) in the video-mem.
: >Don't ask me why.
: >(It's one of the worst things, since you can't say, in which way
: >VDI and Hardware-color numbers are connected (exepct you test it
: >on the screen...)

: See above - the first time I saw this documented was in 1986 in ST-World.

Do you think that's a reason???
What is it good for?

(The only explanation I have, is that on the one hand a bitmap completely
filled should be black (so it must be 1 3 15 255), on the other hand black
should have the same number independent from the number of colors, so it
must be 1...)

: Actually, there is no real reason why he cann't do this if he wants a blindingly
: fast editor. I beleive that Tempus does some similar tricks (and worse) to get
: it's speed. If written well (ie. using vq_extnd() to get the full display infos)
: the program should work ok on all direct addressed screen modes. Ok, it'll
: be no use on a gfx card, but then, you shouldn't need it with a gfx card anyway,
: as they tend to have their own processor to do the shifting about anyway

: bitplane would work fine, and due to the 16 bit interleave, would probably give
: a useful improvement in speed. If he's clever with the window placements
: (ensure window interior always on 16 pixel boundary) then the technique can
: be used under GEM instead of going for a full screen (EMACS style) effort.

Ok, you're right, that a very careful programmer aware of the problems
might use such tricks, and it's possible to do that in a way which
doesn't destroy hardwareindependence.
However I hadn't had the impression that that was what the author of
the orignial question was going to do... (maybe I've been wrong)

I think Tempus isn't a good example here because it's not hardware independent

I like it very much, but I don't like, that it won't run on MagiCMac,
Janus and so on...
Tempus was written long ago, and a fast texteditor might be done
today without the illegal tricks tempus uses (just use NVDI).
I would not accept Tempus if it would be a new programm of 1995

: >That's the way TOS-software was built in 1985 but I think that's
: >quite some time ago...

: Sometimes you have to hit low levels to get real performance.....it depends
: what you are aiming for. For myself, I normally try to stick to OS calls,
: but where they don't give you what you need, you do what you can....how
: many falcon users use Atari's standard video modes - all the extened screen
: drivers are hacks, yet no-one has any problems with them. Same goes for
: NVDI, WinX & loads of other stuff. Just 'coz it's a hack, it doesn't mean
: it cann't be a stable compatible piece of code...it just means the author has
: to take more care over it.

There is a difference between a os-substitute like NVDI and an application.
The OS has to use the hardware, but it's the task of the OS to
stand between applications and the hardware...

Well, I'm the original author. My idea was to have the user select
whether to use the `dirty' way (because he's got an 8 MHz ST) or the
`legal' way (because he's got an Eagle 060 with SuperNOVA anyway).

>I think Tempus isn't a good example here because it's not hardware independent

I like the idea of user-selectable algorithms. I'm busy programming
my Speedo Wordprocessor (while we're on it, please think of a nice
name for it - I'm out of inspiration :-) the `legal' way. If it turns
out too slow (on my Falcon) I might resort to `illegal' stuff. I will
first try legal assembly, though.

SICK FALCON030, WHERE ARE MY FILES??

It was a sunny Saturday morning, I switched my FALCON on like I've done 1000 times before, and to my horror, it crashed {4 bombs} while booting up. (Please read on, it
gets worse!)

I tried warm starting several times, but it crashed {4 bombs} each time. I tried cold
starting several times, it did the memory test ok but then crashed {4 bombs} each time.

So I booting from floppy (i.e. without the harddrive). I tried AHDI several times,
but each time I got the following:

```
  Loading...
  -----------------
  Atari Hard Disk Driver
  AHDI 6.06 June. 2 1993
  -----------------
  Doing programmed I/O for IDE:
  IDE devices:
    Unit 0 - <<<<<<crap>>>>>>
  SCSI devices:
    Unit 0 - Not responding
  -----------------
  NOT bootloaded
```

Where I've put "<<<<<<crap>>>>>>", there always used to be a 6 digit code, but now there's a line of strange characters.

As well as AHDI, I also tried HINSTALL, which wouldn't let me install or remove. But
the system info (time/date/chipset/etc) all looked ok. It read files from floppy ok,
and executed code (from floppy) ok.

Next I tried to reset the NVRAM, (it seemed like a good idea at the time!). It did
something, because AHDI then *did* work (started harddrive). The FATs and directories
look in tact at this point, though I didn't do a complete test.

Then I tried rebooting, and it's now totally buggered since the reboot! It powers up,
the ATARI symbol is buggered, but it memory tests ok, but it neither boots harddrive
nor boots floppy {2 bombs}.

HELP!! Can anyone suggect what might be wrong? Has anyone got any details about the
NVRAM, or details about the _exact_ sequence of events on powering a FALCON up? What
does "Doing programmed I/O for IDE" mean and do? How much is it going to cost to
repair, and what's the chance of saving the harddrive?

And help would be appreciated! If anyone would like a UUencoded, postscript summary
of the above message, please Email me (at jrc1@axprl1.rl.ac.uk).

Thanks for your time,
James

VDI Team !

In order to write a new VDI we have some persons who will do the job.
But we need more specialists to get ready in time. The project will
start as soon as we have enough people to get ready in time !

The job is well !!! _payed_ !!! and it's used to write a new Atari OS Clone !

Who is needed ?

- C/C++ programmer (C++ preferred !)

- VDI specialists in C and/or assembler (MC 680x0, later PPC)

You are interested ?

So DON'T loose any time and contact me NOW !

Filipe.Martins@unidui.uni-duisburg.de

Please state clearly :

1) I'm interested & capable to do the job in a team !

2) Your Snail Mail adress

3) projects you have done before & what you can do

 (I'm a specialist about e.g.: C++, VDI routines,...)

Best regards, Filipe :)

Have you checked your IDE-drive cable? I had a similar problem. It was the IDE-cable which had come loose.

cheers,

Hi,

Just a quick question regarding v_pline(): it seems to draw lines of inconsistent width, horizontal lines typically thinner than vertical lines. It appears to me that this is done to compensate for the pixel aspect ratio in ST-MED mode? I get this problem when the aspect ratio is 1:1, say 640x480.

My setup is Falcon/Tos 4.04/VGA.

The question is, is there a fix for this problem?

Here's source code for my test program:

```
---------------------------------------------------
#include <aes.h>
#include <vdi.h>
#include <tos.h>

int main (void)
{
```

```
    int dum, vh;
    int in11 = { 0, 1, 1, 1, 1, 1, 1, 1, 1, 1, 2 }, out57;

    appl_init ();

    in0 = Getrez() + 2;

    vh = graf_handle (&dum, &dum, &dum, &dum);

    v_opnvwk (in, &vh, out);
    if (vh)
    {
        int points8 = {
            10, 10,
            30, 30,
            50, 30,
            50, 50,
        };

        v_clrwk (vh);
        vsl_width (vh, 3);
        v_pline (vh, sizeof(points)/sizeof(*points)/2, points);
        v_clsvwk (vh);
    }

    appl_exit ();

    return 0;
}
```

This should be fixed in the latest (pl46) release of MintLib, if
it isn't get the less-200 source, it comes with a regex-library
which compiles out of the box. (Takes some time on a ST:-).

>Can someone tell me if Geneva places a cookie in the TOS cookie jar?
From the Geneva manual:

"If Geneva is present, there will be a cookie called 'Gnva' in the cookie
jar. This cookie either contains a pointer to the G_COOKIE structure
defined in the file XWIND.H, or it contains zero. If it contains zero,
this means that Geneva was previously installed but is no longer."

The G_COOKIE structure is:

```
#define GENEVA_COOKIE   0x476E7661      /* "Gnva" */
#define GENEVA_VER      0x0102          /* current Geneva version */

typedef struct
{
  int ver;/* Geneva version */
  char *process_name;/* Process currently using Geneva */
  int apid;/* apid of the above process */
  int (**aes_funcs)();/* internal table of AES functions */
  int (**xaes_funcs)();/* internal table of extended AES
  functions */
} G_COOKIE;
```

Yes. Here's an example:

```
    function();
```

:-)

I guess you meant to ask whether it was possible to run a function as a concurrent process under MiNT. Yes, it is. Check out tfork() in the MiNT library (thread.c). Here's an example of how to use it:

```
    tfork(function, argument);
```

tfork() basically sets up a basepage for the new process with Pexec(5, ...) and then executes it with Pexec(104, ...). Parent and child share all their memory.

Oops - I must be doing something wrong then since Linux 0.9pl5 works quite happily on my Falcon with internal 127MB IDE and external 540MB SCSI drives. While installing I occassionally got SCSI timeouts when untarring large archives but now the system is perfectly stable and both drives are available under Linux.

I have a Minix partition on the IDE drive which I can also use with Mint and have Linux on the external drive in case anything goes horribly wrong (which it did once when I had it on the internal IDE - bye bye partition tables!).

It has taken me a couple of weeks to get a working system but is well worth the effort if you want a real Unix. I now run X Windows and GCC perfectly well on a 4MB machine. A little slow perhaps but great fun and very usable.

summary: What about the software ?

If, as it has been reported, Atari are no longer supporting ST/STE/TT/Falcon development, then I have a request for them :-

WHY DONT YOU LET THE LATEST VERSION OF TOS, MULTITOS Etc OUT TO US ???

With the obvious expertise available in the 3rd party market, with excellent products such as NVDI, MagiC, Neodesk and GEM bashing desktops such as Ease, Neodesk etc... These products can still be developed by 3rd party software producers to produce a Windoze, Windoze 95/96/.../2000 and System 7 beating OS for our platform. (OK I know it's better than Windoze3.x already !!!].

With the improved marketing started by Clab (Yes... I've actually seen a Falcon MKII advert in a non-Atari magzine..) a decent OS is all we need to revitalise our machines.

OK so the ST and STE have probably had their day. But the Falcon, TT, Medusa etc ? I think that they could continue long into the future with the right marketing and software base.

Come on Atari... You've sold off your hardware. What about the software ???

Hi Filipe,

you are looking for VDI - Specialists in C.
I am interested to write a new ATARI OS Clone.
I prefer to write VDI - Routines in C (Turbo).
Please send me more Information.

Best regards, Thomas.

Hello,

has anyone a description of the PCX-file format for graphics?

And how can I copy (on all grphic cards and extensions) an 2-bitplane color graphic to the screen. vrt_cpyfm and vro_cpfrm seem both not to work!

Ciao, Markus

keywords: GEM,Atari,XAES
newsgroups: comp.sys.atari.programmer
summary: Well, is there one???

Is there a programming library (for C or Basic) which provides procedures for 'fancy' GEM bits, like popup menus, windowed dialogues and the like?

I've been programming a library myself, but ran into a few difficulties

(for instance, when a windowed dialogue is moved off screen, the input fields fail to work properly. I suspect there's a problem in my customised form_do, any ideas?), and it would be easier to use a pre-programmed library which is almost certainly going to be more bug-free and compatable than anything I'd do.

I had XAES (I think..) but couldn't get it to compile in the C compiler I have (I should think about getting TurboC, I think), and from the demo program, It looks far from finished (the menus in the demo program are very odd..)

I'd be grateful if anyone knows of a library that I can get from an FTP site.

Thanks,

Brian

I will! but unfourtunally an source-code isn't as good as a text-file which describe the way I have to do it! but If I get some info on how to do it, the source will defenitly help!

Hello Netters,

On 2/14/95 CBS Evening News with Connie Chung, Dr. Bob Arnot did a story about negative ions and their effect on mood. They talked about a study done at Columbia University where exposure to a high density negative ion generator was as effective in treating winter depression as medication.

I became very interested because I have suffered from depression and anxiety for years, and I did some research on the benefits of negative ions.

This research turned out to be especially interesting to me because I found a newspaper article discussing the fact that computer monitors emit positive ions - the opposite of negative ions. The article says computer monitors give off large amounts of positive ions and can actually cause depression, stress, fatigue, etc. in people who sit in front of computers a lot - like all of us Netters - and that we need negative ion replenishment.

After reading the article, I realized that I always felt especially irritable, stressed, and depressed after long days in front of my computer.

In doing the research, I found that negative ions have shown to be therapeutic for stress, irritability, fatigue, depression, etc. So I purchased a small, high density generator and it has given me substantial relief from my symptoms.

If any of you would like me to e-mail you that newspaper article, the transcript of the CBS news story, as well as the other research that I have compiled, just e-mail me at DanielS222@aol.com.

-dan

Anybody know what type of PS/2 module the HARD & SOFT Falcon Ram Card requires?

W or W/O parity???

Thanxx, and regards, Peter.

Doesn't work on a Falcon for some reason.
In fact, I've tried all sorts of ways to detect whether the printer is
on-line (including Bcostat) on a Falcon and none of them work.
It may be TOS 4 or the Lattice C libs.

All that xmkmf actually does it to filter the makefile template
through the C preprocessor after adding some #include's of
configuration templates, and postprocesses the output by re-inserting
backslashes at the places that are marked with `@@'. I should not be
too hard to do that by hand.

Hi,

Watching the strange color flickerings on my Falcon scrolling text
in a window in 16 color mode, I got an idea for an *extremely* dirty
solution to both speed up the scrolling with a factor 4 *and* loose
the annoying flickering. It assumes you're using black-on-white text,
with white being color 0 and black color 1 (but in fact will work if
`white' and `black' differ in only one bit of the register). Since
the bitplanes are stored separately, what if you'd just ignore planes
1-3 and only scroll plane 0? That would save a factor 4, even a
factor 8 in 256-color mode.

But, alas, I rejoiced too early. The bitplanes are `interleaved'
which renders my plan almost useless. How exactly are the bitplanes
stored in memory? Interleaved in words/longwords? Can I save time
only scrolling the first byte from groups of four, or would that even
be slower? What about the 16 bit bus? I guess I could only reduce
the flickering...

Any comments?

Regards,
--

Your idea isn't dirty at all, it is in fact the good way to gain time and/or space when you've got to display something on less planes than you've got (like, for instance, 32-color backgrounds, which take 5 plans instead of 8, that is 37.5 % memory saved, 24000 bytes on a single 320*200 256c picture)

Just what do you mean when you say that the planes are interleaved? When in 2/4/16/256 color mode, the pixels are stored in packs of 16, in packs of 1/2/4/8 words, every word containing the Nth bits of every pixel's color number, where N varies from 0/1/3/7 down to 0, from the left to the right:

Example in 16c mode: 16 pixels, colored from the left to the right with colors 15 to 0, will look like this:

```
          bits 3           bits 2           bits 1           bits 0
     1111111100000000 1111000011110000 1100110011001100 1010101010101010
            ^                ^                ^                ^
bit no  FEDCBA9876543210
```

So I take the 12th bit (0 being the right one) in every word, put them together and I get %1011=$B=11, which is color 12 when you start from 0.

If you want to scroll one plane, all you've gotta do is scroll one word every 1/2/4/8 words , kinda like this:

```
     moveq    #19,d7
.loop    move (a0,d0.w),-8(a0,d0.w)
     addq #8,d0
     dbra d7,.loop
```

which will scroll one 16c,320pix line 16 pixels left.

This method DOES really save time/space when you need it (even if you don't!).

Hope it will help.

```

Hello Hague & everybody else who has problems with long file names !

To see long file names you need Minix XFS 0.60 PL11, MINT 1.12 and
Gemini 1.a or Thing 0.24 of course !!!
The normal desktop will cut all long names to 8+3 !!!

Best regards, Filipe :)

This intended for Andrew Hague and everybody who needs help for
installing Minix XFS !

First make sure that you have TOS 1.04 or higher !
Working with 1.0 & 1.02 doesn't make much sense... :(

TOS 2.06, 3.0x or 4.0x is great !!!

First you need MINTNP.PRG in c:\auto as last program !
If you have MINT.PRG (MiNT 1.12 or 1.12 H2) rename it to
MINTNP.PRG ! So programs like Outside (Virtual Memory Manager)
can work ! (VRAM does not support MiNT 1.08-1.12... but this might
of course change in the near future)

Initialize drive d:\ or higher (don't use c:\ !!! c:\ is needed to boot !)

copy minix.xfs (and GEM.CNF & MINT.CNF) to c:\

So now while booting the Minix XFS startup screen must appear which states
that you use Minix XFS 0.60 PL 11 ... etc...

start:

1) minit.ttp -P -V -n 8 d:
   n is the directory increment !
   -P means it's protected against being started without Minix.xfs !
   -V means it's modern V2 filesystem instead of an old V1 filesystem !
   d: is the drive ! Except c:\everything is possible... d:\, e:\, f:\ ...

```
   etc.

   n=1, 2, 4 & 8 is possible !

   n= 1: -> 16 * n - 2 = 16 - 2  = 14 (doesn't make sense !!!)
   n= 2: -> 16 * n - 2 = 32 - 2  = 30 (better !)
   n= 4: -> 16 * n - 2 = 64 - 2  = 62 (perfect)
   n= 8: -> 16 * n - 2 = 128 - 2 = 126 (possible but not necessary !)

2) mfsconf.ttp d:

3) fsck.ttp -S d:

4) csize.ttp  minix.xfs 64 64 64 (install 3 * 64 KB Cache ! System, user &
   inode cache !!!)

That's all !

while using fsck.ttp -S d: it complains that the cache cannot be written out.
Ignore it and start it again. Now it disappears !

I hope that helps !

If you have a very big partition, you must use minit.ttp -t d:
Now you get to know how much blocks & inodes exist !

These can be needed if it refuses to execute minit.ttp !

NOw you you would have to type minit.ttp -b xxx -i yyy -P -V -n d:
or the other way round...
I'm not sure whether you need -b xxx -i yyy or -i yyy -b xxx
because I'm sitting at an Unix computer now...
But if you start minit.ttp without parameter it will tell the right
order of the commands !!!

So, I think this was helpful, a bit ...

If there are questions left, just ask me:

 Filipe.Martins@unidui.uni-duisburg.de

or the author S. Henson...

Bye :)

actually, the code should be more like:

```
     char *screen = Logbase();

     void putpixel (int x, int  y)
     {
          screen(y * 80) + (x >> 3) |= 1 << (x & 7);
     }
```

I tried yesterday to initialize a partition on my hard disk with MINIT.TTP in
order to have a Minix file system for Mint.
But it refuses to initialize it ! As the size of my partition is 170Megs, I
wonder if MinixFS can work beyond the 32Megs limit.
Any clue ?

Setup: MegaST4, PAK/3 68020-68882 16Mhz, TOS 2.06, ICD Advantage+, ICD drivers
ver. 6.5.5 and a free disk (for Mint) of 170Megs (Quantum LPS170S)
and for the soft: MiNT 1.08 - 68030, GEM AES 4.1

Follow-Ups to comp.databases Please

I have a dBase file on the Atari and want to convert it to a FoxPro file
on the Macintosh. Probably some intermediate step is necessary:
first to dBase (MS-DOS) or FoxPro (Windows) and then to FoxPro (Macintosh).

Has anybody experience with such a conversion?
Please reply even if you can tell only about conversion from Atari
to MS-DOS or Windows.

Thank you for any hint.

As far as I recall, the DBF format is binary compatible across platforms so
all you should have to do is get the file onto a disk that the Mac can read.
No other 'conversion' should be needed.

> Hi, can anyone tell me how I can play 4 samples at the same time using
> my STe and GFA basic?

This can be done very easily on an STE, but needs some 'massaging' of the sample data. The sample data needs to be set up like this -

ABCDABCDABCDABCD....etc

where A, B, C and D represent bytes from samples 1, 2, 3 and 4 respectively. I.e. the samples must be interleaved. Then set the DMA sound to play at twice the speed of the sample - so if the samples are at 25Hz, set DMA to 50Hz and play in stereo. The result is samples 1 and 3 played on the left sound channel and 2 and 4 on the right sound channel.

There are commands in GFA 3.5 E or higher for controlling DMA sound but I'm afraid I can't remember them offhand... if your GFA is an earlier version you must use the hardware registers which I am even less likely to remember offhand. :)

Well, here is a subject which may be of interest for games programmers.

I started to code a fighting game in True Color on Falcon, and the background scrolling is achieved by hardware scrolling. The problem is the fact that the video base adress must be a multiple of 4bytes (perhaps due to the fact that the VIDEL access via 32bit bus to the RAM). Well 4bytes mean 2pixels in TrueColor, you can imagine what it does when you're waiting a 1pixel scroll.

The only solution I found is to shift the screen by 1 pixel to the left using the VIDEL specific registers (horizontal position on the screen) HDB and HDE (horizontal display begin and end, see adresses in the Atari Compendium or any file chating about Falcon hardware)

Does someone tried to do this in another way ?

See you next time, netters !

Yes it can
Try setting up a V2 file system, as I had a similar problem where a 128
Meg partition was set up to only 16 Meg without specifying this.
I also decides to tell it the drive parameters, just to be sure.

Sorry, that was a "typo". Should be Bcostat!

> Doesn't work on a Falcon for some reason.

> It may be TOS 4 or the Lattice C libs.

I use Lattice and TOS 2.05 and tested this fragment:

```
#include <osbind.h>
#include <stdio.h>

if(!Bcostat(0)) puts("Printer is offline!");
```

That worked with a Star Lc 10.

Are you sure your printer is online? (Maybe a stupid question but you
could be out of paper or something..)

There is another call: StatusOK = Cprnos() /* test printer output */
Returns nonzero if "there is room for at least one more character".

AND (This may be it!) gemdos calls *only* work when you "default to short integers" (or typecast)

When are we going to see the birth of MagiC for Falcon? We've been told there'd be a Falcon version of this excellent multitasking utility. However, they never came up with it. Any info on this matter?

STOS FAQ v0.8a

Generated by: STOS Mailing List - stos@bath.ac.uk

Enquiries: Should be sent to Les Greenhalgh - Email address in Authors section.

Authors: MUG U.K(tm)/Mike Mee
c9251129@zeus.hu.ac.uk - a.k.a ()rm of Digitallis/Jon Lewis
Mark.Montreuil_DGNM@banyan.dgim.doc.ca - a.k.a Mark Montreuil !
ma2lgj@bath.ac.uk - a.k.a Les Greenhalgh
ae@minster.york.ac.uk - a.k.a Andrei Ellman

This FAQ will hopefully answer all the questions you have on the programming language, STOS. If you wish to add any new sections to this FAQ, please send an example outline to the above Email address.

Abbreviations used.

STU - ST User (more commonly known as ST User)
STF - ST Format (more commonly known as ST Doormat)
STR - ST Review

BTW - By the way
sp? - Spelling confirmation required ! We maybe coders, but there is no
      guarantee wee kan spel !

[ ] - Comments from a mailing list member - usually Andrei !

1. What is STOS ?

Written by Francois Lionet and Constantin Sotiroupolous (Spelling please?)

Published by Mandarin/Europress Software

STOS is the forerunner to the Amiga version, AMOS, AMOS Pro etc..
And its a great shame that STOS hasn't been supported by Mandarin since
they released AMOS Pro because there are a lot of people who use their
language and get frustrated because they can't call for help!

Mark Montreuil came up with this definition .....

STOS (for ST Operating System) is a programming language based on BASIC (Beginner's All-purpose Symbolic Instruction Code), that makes creating sound, graphics and movement on the Atari 16/32 bit line of computers as painless as possible. STOS has commands that handle input/output, animation, music, logic and program execution in an easy to understand way. A STOS programmer can spend more time on actual game design than on the "fiddly bits".

Many things that were not considered possible, such as changing screen resolutions in the middle of a program or writing Arcade-type games in a BASIC language, are a reality with STOS. Hundreds of quality games, demoes, utilities and educational packages have already been written in STOS.

STOS is a full-featured software development tool. Using STOS, art screens created in specialized paint packages, like Degas, Neo or Crack Art, can be easily used to create basic game graphics. STOS has built-in Sprite, Music, Map, Font and Sound effects generators. You can write some code, and, at a keypress, call up any of the added utilities (called accessories) to work on added features. You can even write your own accesssories, to use at any time.

Machine-code routines can be called from within STOS, and new commands (called extensions), can be written to enhance STOS's functionality. Some extensions that are currently available include 3D, the Missing Link and Misty (see Extensions for further information).

All in all, STOS is the perfect tool to bring your game ideas to reality without having to trudge through reams of machine code!

Cheers Mark for the few above lines on STOS. Anyone else fancy adding more to it ??

---

2. Where do I get hold of it ?

Has been given away with magazine cover disks, ST Format and ST User (I need a list of which ones!). The problem with the versions given away with the magazines is that they were no manuals.

Also most mail-order firms should stock a copy of STOS. Try to haggle and get some decent prices. Don't buy the Interpreter without buying the Compiler !

Apparently every ST sold in Britain comes free with a copy of STOS with the manual thrown in. Any more information on *exactly* you get would be appreciated. If you have the spare money and you want an extra development machine, then it maybe worth getting hold of one ?

()rm has suggested that you look at bargain buckets in computer shops or check out the odd car-boot sale. But that is ()rms sense of humour !!

---

3. What is it like to program ?

()rm says .....

STOS is BASIC, but a powerful version of BASIC. It has built in sprite handling routines, music commands, sound effects and numerous other routines, functions and commands which can be very useful.

At first glance STOS looks horrible, but after a few weeks of programming it, you will wonder how you ever lived life without it (OK, not the truth, but it IS good for something!)

As STOS is based on BASIC, it is very easy to program, in fact, I'd go so far as saying STOS is the easiest BASIC to write anything in. Everything can be set up very easily, for example, you want to play a sample yeah? Get the sample player extension, whack it in the STOS folder and then re-boot.

(Or for those lucky hard-drive owners, unlike ()rm, copy all the extensions into your STOS folder and leave them there !!)

Now play your sample with the command SAMPLAY.. No need to load routines into a memory bank, peek and poke a few numbers and call it. This is one of the nice things about STOS, its upgradeability..

Pity that the language hasn't been given a major rehaul with all these new functions BUILT IN.

Andrei has this to say on the matter ....

When STOS was designed, it was made to make writing games easy. The programmer would think mostly on the WHAT, rather than the HOW. In other words, it was supposed to make you able tp program games without having to think about how tyour ST works. For example, sprites could easily be displayed, moved, and animated with ease. Unfortunately STOS sprites tended to be a bit slow, but The Missing Link extension replaces STOS sprites with Bobs. Bobs are a bit more tricky to implement (you have to move and animate and erase them yourself), but they are much faster than STOS sprites. There is a similar story for other aspects of the language.

STOS is a BASIC that uses line-numbers. This tends to be messy and often encourages programmers to write "Sphaghetti code" (There are gotos running all over the place). It would have been better if STOS had no line numbers, but would call procedures by their names, and have one command per line which was indented appropriately.

---

4. What extras are available to compliment it ?

STOS Compiler - Actually makes your programs faster (HAHAH!)

STOS Maestro - Sample playback routines for STOS (and sampling hardware depending on which version you buy).

STOS 3D - Add 3D commands to your games. Only drawback is that all the objects have to be loaded from disk each time they are required.

STOS Tracker - Playback tracker tunes, albiet a bit slowley..

Andrei has added this as well .....

I have heard about a program written in STOS which adds proper procedures to STOS and gets rid of line numbers. I believe that this compiles the new type of code into STOS. This was originally listed in a STOS club newsletter, and Goomans have a copy on disk. Does anyone have experience using it?

---

5. Can I *really* write commercial quality games with it ?

Commercial Games

Check out:

Bullet Train (revamped version was released in France a few years ago)
Bumpy
Cartoon Capers (also came with a dual-joystick extension)
Cool Croc Twins
Gilberts Day Out
Prehistorik
Skate Tribe
(We think there's a few more..)

Educational programs

All Fun School programs (also have full STOS source on disk)

Henrietta Series by Lander (also with full STOS source on disk)

Loads of other educational programs by other firms. Some names would be appreciated.

Commercial quality shareware/public domain games

There are also a few examples of top quality shareware games written with STOS. So grab a hold of your favourite PD library and ask for the following:

Grandad & The Quest For The Holey Vest by Ian Scott.
The Glass Buttock of Tharg by Ian Scott.
Grandad II - The Search for Sandwiches by Ian Scott.

Ozone by Nick xxxx (can't remember his surname!) - was turned down by Ocean at the last minute because they found out it was written in STOS.

Pyscho Pig, Sim Pig, Colour Clash, Fatemaster by AnimalSoft.

Plop by ()rm - apparently the freebie you get when you register is better!

Bio Hazard by Les Greenhalgh.Dungeon Master in space type thing.

Most of the stuff by Andrei (some feature STE 8 player options) of which he himself recommends the following: Linecrash, Mazewar ST, Video Games v0.5 Pacmen, Alienation (currently undergoing a re-write) ?

---

6. Are there any books available ?

As far as I know there is the one by Stephen Hill, which was published by Sigma Press. Its title is Games Makers Manual. It teaches you a seperate game style within a chapter, and for the more advanced, gives you the lowdown on writing extensions.

There is a STOS guide published by a PD library, but whether its any good is another matter all together. It is 30 quid and contains some 400 pages of STOS related stuff. Takes you from the complete beginning and shows you how to write arcade, strategy and educational programs. Anyone out there know how good it is ?

Disk Magazines/Newsletters

Not exactly books, but disk magazines are in abundance. Some contain partial STOS sections, whilst there are (or in some cases, were) others which are STOS related and nothing else is mentioned.

Check out:

STOS Bits 1 (now dead - forerunner to HP Source)

HP Source 1,2 (now dead)

STOSSER Disk Magazine (still going - now on issue 19 ?)

ST Programmer (I've only seen one issue!)

Ledgers (had an occasional STOS section)

Maggie (in amongst the swear words was the occasional STOS column)

Anyone know of any other magazines ? Please send in details of whether the magazine is going or not.

Also required is a compilation of what was printed in ST Abuser, ST Doormat and ST Review regards STOS, along with a similar listing of useful routines and articles from STOS Newsletter. Unless, there is already one available.

According to Andrei, New Atari User (still alive?) had a STOS column in the 16-bit suppliment ? Also there is the Atari Magazine, a French mag which also has a STOS column or mentions it occasionally !

There is an online-help program for use with The Missing Link. This handy reference guide will give you the keyword and appropriate parameters for each Missing Link command. Just like Windows Help files on a PC !!

---

7. What are extensions, and where do I get them from ?

Extensions are a way of further expanding STOS. All the following are extensions, Compiler, Maestro, 3D and Tracker (Released in the P.D.)

There are numerous extensions in the public domain. The favourites being MISTY and MISSING LINK, both been written by a group called Top Notch. They add commands which SHOULD have been in STOS from the start. Andrei has sent me the following exhaustive list of extensions available for STOS. It was in two parts, one by Andrei and the other by Les Greenhalgh. I will use Les' version as it lists the FTP sites where most of them can be found. Take it away Les .....

The consise guide to Stos extensions.
By L.J.Greenhalgh

Terminology

a.a = atari archive umich edu in either language or progamming folders
k.l = can be found in ftp.ftp.uni-kl.de in the directory
pub/atari/programming/STOS/extensions
s.w = Shareware
cr = Shareware version is crippled
pd = Public Domain and freely available

GI = Goodman International PD Library
STF = was on an ST Format cover disc

Misty extension by Top Notch Software (sw STF)
Can be found: a.a in both Stosers.zip and Misty.lzh files
Miscellaneous graphics commands including an improved screencopy which can use any of the STs bitplanes, instead of 4 at a time in STOS.
Excellent stuff.

Missing Link extension Top notch Software (sw cr STF)
Can be found: a.a in Link1.lzh - Link3.lzh
about 50 new gfx commands including replacement sprite commands and commands for dealing with maps and multiple palettes on screen.
A must have.

Extra extension by Martin Cubbit (pd)
Can be found: a.a k.l extra.zip also in cyber.zip
loads of miscellaneous commands including cookie reading commands, mirror and blur sections of screen , paste strings in opaque mode, format text, detect tos version etc.
Brilliant

Stars extension by Lee Upcroft (pd STF)
Can be found: a.a stossers.zip
Commands for drawing 3D and 2D starfields, very quick.
Excellent.

Blitter extension by Asa Burrows (sw STF)
Can be found: a.a in their uploads folder in blitter.zip
Commands for using the blitter in MegaSTEs, MEGASTs, STEs, Falcons?
Seems a bit slow.

MIDI extension by Asa Burrows (pd STF)
Can be found STF , GI
Commands for using the STs MIDI port.
Never used it.

Stos Vidi extension (c)
Commands for interfacing with the Rombo VIDI digitiser.
Never used it.

Stos Maestro (c)
Commands for playing samples through Stos, excellent although better performance can be obtained from the Missing Link's Digiplay command.
[AE - I think that TML does not emulate STOS Maestro's reverse playing

abilities]

Stos Pac/Squasher ? (c)
Commands for packing/unpacking all types of memory bank not just pictures. Never used it. Depacking ability surpassed by Missing Link. TML supports packers that can pack tighter than STOS Squasher (eg. Pack Ice). Unbelievably buggy - read docs with Mega Depacker for more information.

STOS Sticks (c) [AE 26-4] Is that Twinstix?
Commands for reading both joy stick ports. Unnecessary, use TML equivalent.

Control Extension by Les Greenhalgh (pd sw)
Can be found: a.a k.l in control3.zip
Includes a replacement sprite engine which allows you to flip images and paste them in either opaque of transparent mode. Allows you to use these images on low rez screens of any size, ideal for scrolling large screens on the STE. Commands for 16 colour fonts, spreading palettes ,commands for reading a parallel port joystick adaptor, a switch construct for STOS,border removal commands, a super fast add command and other miscellaneous stuff.

Quick Extension by ? (sw?)
Can be found: Stossers disczine
Commands for super fast horizontal scrolling, rasters, stars.
Seems good.

STOS TOME by Aaron Fothergill (c)
Can be found: GI
Commands for drawing maps, irrelevent now the Missing Link exists.

STOS 3D by Voodoo Software (c)
Commands for manipulating 3D objects, unusable unless you have a hard-drive and 1 meg. Too limited, no commands for rotating around current heading and no commands for representing horizons, ground, etc. Very large files. Objects cannot be stored in banks, but have to be loaded with purpose made extension commands.

Cyber exntesion by Martin Cubbit,Andy Cato and Les Greenhalgh p.d a.a k.l
Allows you to play .seq files from STOS. Very good.

Comming soon...

STOS ninja tracker extension for STE/TT/Falcon
Finally a decent tracker for STOS. Allows you to play protracker mods from a bank in the background at up to 21khz. Commands for vu meters, track frequency,pattern positions and much more.

At least 2 Falcon extensions are under development which will allow you

to use the Falcons higher colour modes including truecolour and the
DSP for playing mods!

Eagle extension.
A mamouth 80 command extension.

Other forms of extensions that you know about would be appreciated in this list. As ()rm recently suggested, all those who are in the process of writing an extension, put your heads together and come up with one mother of an extension !!

There are other ways of improving STOS without having to use extensions. These take the form of machine code routines which you pass some variables and call them. A few of them have been taken from the same list as compiled by Les and Andrei.

Some Machine language routines used with STOS

BITCOPY
This is what I believe to be a routine that is similar to Misty's SKOPY command. Top Notch used this in their demos before they wrote MISTY which now makes BITCOPY obsolete.

BORDER
Top and Bottom border overscan in STOS. STOS runs just as normal, except when you use the mouse/joystick/keyboard, the overscan dies. The top of the screen starts as 'physic', and continues as normal as if the screen was greater than 32K in size. Works on STFMs and STEs.
Found on a disk of the Cunning Demo.

OVERSTOS
Full screen overscan. Can only display a static picture. I think this has problems on STEs. Found on a disk of the Cunning Demo.

RASTER By Neil STewart of Flair
Routine that changes the value of only one colour on the screen. This was later implemented in Son of TML's RASTER command. Can be found on one of the disks from the Cunning Demos by ACO & Flair.

STOS-SPEAK by ?
A patched version of the original SPEAK.PRG - allows you to use speech inside your programs by sending a string of characters to the program.

SPECTRUM (I am not sure of the exact name)
Displays spectrum 512 colour pictures. Very limited as you can only exit from

display by pressing space. Shareware (was once on a STF coverdisk. If you register for 15 pounds (A rip-off), you get a version that can display the pictures in a window. I have not got the registered version. This was advertised in ST Format in 1992)

STOS_512 By ?
Routine that splits the screen into several palettes of 512 colours.
This was later implememnted in TML's PALSPLIT command.

TRACKER
An improved mod player. Found on a disk of the Cunning Demo. ()rm is hopefully going to working on an interface to allow the use of the Ninja Replayer routine from within STOS. More news when he has finished failing his degree !

If anyone fancies adding to the above list, then please do. You know where to send any additional information. Apparently larger lists exist of extensions for STOS, but these can be found in STOSSER magazine. If someone can upload or Email a copy of the latest list, I can add them to the above list.

---

8. Recommended programs - commercial & shareware

A *DECENT* art package. Recommended commerical ones are:

Crackart (recommended by ()rm)
Dpaint ST (recommended by: MUG U.K(tm))
NeoChrome Master v2.28 (recommended by: MUG U.K(tm))

A *DECENT* tracker editor. Try not to rip off someone elses work !

Sample-based ones .....

ProTracker 2 by Wizzcat/Deltaforce
Octalyser by ?? (STE only, but has option for 8 channels of music)

Soundchip-based ones

Megatizer by Sector One.
SID Editor by Animal Mine (improved version of Tri-Sound, with SID Emulation)
XLR8 Editor by Sentry

(all the above have the ability to assign 1 channel to play samples)

Without plugging my own stuff too much, if you can find copies of my 'Makin Sweet Music Disks Vols 1-3', they all contained ripped music from games and demos. Each folder on the disk contained the 68000, GFA and STOS replay routines ! If I can get a tune playing in 68000 or GFA, then I don't see why I can't knock up a STOS front-end.

()rms music player program has all the necessary information on screen for setting up and calling the myriads of music available in the ST music-scene.

How to get STOS up and running on the Newer TOS'
TT & Mega STE

Currently it is STOS FIX v3.0 by ?? and it is only available from Goodman Enterprises ! Charging for a program which fixes your STOS code and leaves a bloody advert for Goodman on the front of your code ....

Falcon
You need STOS Fix 3.00 (given away on a recent ST Format)
by Robert Quez???? This will patch STOS for the
later TOS'. Bear in mind that this will only patch STOS to work on your particular TOS. The author is rumoured to be working on a version which will patch STOS for multiple new TOS'.

---

9. Miscellaneous Section

"What versions of STOS have come out?"
"What is the History of STOS?"

Both questions answered by Andrei.

STOS 1 was only released in France in early 1988 (published by Jawx).

STOS 2.3 Was released in the UK By Mandarin in November/October 1988

STOS 2.4 Is a patch to remove some bugs in STOS 2.3 and make it work with the compiler (1989)

STOS 2.5 Is a patch to make STOS run on the STE (1989)

STOS 2.6 is a patch to make STOS run on STEs with TOS 1.62 (1990)
If your version of STOS is below 2.6, You must update it immediately, especially the compiler. You will then be able to make programs that run on TOS 1.62

STOS 2.7 (compiler only). Makes programs that use the STOS tracker extension compile. I am not sure whether or not it is nescesary or not if you are not using the tracker extension.

Also, FALCOS was being developed (STOS for the Falcon). Apparently, this project was stopped due to a disagreement between Atari and the developers.

"How to make it not look like STOS!" - Andrei answers a few more questions.

- Try and avoid the 'appear' command (unless the appear you are using is fast).

This tends to give the game away. STOS 'appear' does not let you press a key to speed things up.

- Get rid of the F-key window first.

There is nothing more "Written in STOS" than seeing the F-Key window when you have just loaded a game. Alter this within the compiler settings.

- Change the font.

The Lo-Rez font also gives it away. I personally use the font of the Atari 8-Bit computers.

- Change the mouse pointer - almost as ugly as the AMOS Professional one !

- Different type of cursor - everyone recognises that thick ugly cursor !

- Avoid using the SHOOT and BOOM and BELL commands unless nescesary. Replace them with sound effects from a piece of hacked music ! Try the following:

  Count Zero - Killing Game Show (20 SFX)
  Mad Max - Numerous pieces have Sound FX embedded
  David Whittaker - His fast music may be awful, but most have SFX

- Replace the STOS keyboard click or get rid of it completely. There is a poke to use the standard ST keyboard click from STOS, but I don't remember it. [Details would be nice !!]

- Different windows and File selectors (not sure about the new Windows extension).

You may want to mention that it was written in STOS directly on the title screen, or say this in the documentation. The idea is that as well as letting people know it was written in STOS, it can give the WOW effect if it is good.

Shrinking the size of your compiled code by MUG U.K

Well, this section is fairly easy to do. Follow these simple rules.

If you have ANY other packer not listed here, BIN IT! It is either incompatible with the Falcon, or has a pack ratio similar to that of the original versions of the Jek Packer - ie. rubbish !

Packers - The Definitive List

Speed Packer v3.0 - definitely the best. AUTO Depack program as well as Self-extracting archives !

Atomic v3.5/v3.6 - second best. Apparently does not work on the Falcon but I will release some source code that might allow you to make your own program headers for data file packed versions of Atomik files.

ICE v2.40 - Stalwart and much used packer. Still used after all these years. Compatible with the Falcon but it cannot match the above two for output size.

Anyone recommend any others ?

Depacker Programs

I can heartily recommend the following programs for converting your old packer formats back into STOS code so you can patch them and repack them to work on newer machines. Try....

Multi Depack v1.5 (or the leaked preview versions of 2.0/3.0) - I wrote this!
Mega Depacker v2.12 (by Mike Watson)
Naughty Depacker
New Depack (new name for Mega Depacker)

If the program will not depack with any of the above, then there must be a reason why it won't let you unpack it !!

Well this is the end of the STOS FAQ, designed and written by members of the STOS Mailing List (stos@bath.ac.uk).

Anyone is welcome and indeed, encouraged to send in alterations and additions to this FAQ.

We hope you found it useful. Any Public Domain library is allowed to distribute this FAQ, but please do not distribute any versions lower than v1.0 as they are pre-release and probably quite embarrassingly small in size. Also do not forget to credit that this FAQ was generated by members of the STOS Mailing List.

The title says it all. I've been looking for this stuff for quite a while.
For those who don't know it: it's a bunch of subroutines to facilitate "3D"
windows and panels.

A reference to the proper FTP site would be okay too, but if you do have
any info on this, please mail it, because I'm not a frequent news-reader.

Thanx in advance!

(Flames redirected to Ritzen)
Take care,

    Angelo

Ahhh... I have been trying to sample and play samples in my own programs
for a while now (well, more like a fortnight :-), and am having problems.

Basically, I set it all up with:

```
Setmode(1);       /* set playback to 16-bit stereo */
Setmontrack(0);   /* set speaker to track 0 */
Settrack(0,0);    /* set it 1 track play/record */
```

and then play a sample with

```
Devconnect(0,8,0,freq,0); /* connect DMA to DAC */
Setbuffer(0,start,end);   /* Set start / end pointers */
Buffoper(1);              /* Set Play enable */
```

This plays the sample correctly, but does not stop at the end of the

sample. What am I missing? The same thing happens with record....

BTW this is all in assembler, not C....

Cheers

Anthony

In one of the MinixFS docs (can't remember which) it said that MinixFS
will work with >32meg partitions as long as:
The partition letter is below P _OR_
You have XHDI version of at least 2.10 (or was it 1.10??? Something like
that anyhow.) Don't ask me what XHDI is.

Hope that is of some help,

Depends what you call "full support". It does contain binding for the extra Xbios() etc functions. But contains knackered Speedo bindings. Contains a version of Wercs that does _not_ understand modern format resource files (eg the DESKCICN.RSC file). It also contains very little documentation on new stuff (eg DSP).

HiSoft are on record as saying that there is very little chance of seeing another release of Lattice C for the Atari.

No! There is no need to use the 'line trick', as the VDI has a pixel
plotting command! It is called v_pmarker().

All looks good to me. If you are working in assembler, remember that the end and start addresses must be pushed onto the stack in reverse order - i.e. push end address first then the start address. If you are using a library of some sort check that the code in the library pushes the addresses in the right order.

XHDI is the eXtended HardDisk Interface Standard which was defined in 1992.
Hard disk drivers that support XHDI offer a lot of useful functions for
getting information about the hard disks connected to your Atari and have
several calls which enable high level programs to communicate with hard
disks in a convenient way.
You find the complete XHDI documentation on ftp.uni-muenster.de in
pub/atari/Docs. The documentation is available in English and German.
Drivers supporting XHDI are HuSHI, hdpSTACK and HDDRIVER.

I'm just wondering if it's possible to do inline assembler with pure c. With gcc I can use __asm__ to do this but I don't know if Pure C has some similar directive.

All help appreciated...

Hello all,

I have managed to compile the following for MintX with 68030/FPU options:

1. Xv 3.10 (the latest version). This is the latest gif/jpeg/tiff/etc viewer for Xwindows - it even has cut and paste! I compiled for 68030+FPU, if there is enough interest I can try compiling

ST (68000) and Falcon (68030 nofpu) versions and upload to an ftp site. Picture manipulation with an FPU is incredibly fast!

2. Gnuplot 3.5 - Also for 68030/FPU - plots into a window - also very fast with FPU. I still have a file loading bug to fix on this. Allows output in many different latex formats.

3. Xdvi - this is great - it works with any currently existing CS-TeX setup so that you can use the files currently on your TOS partitions without copying anything to a Minix partition. The way it looks for fonts is SO flexible with an environment variable that any existing Tex setup for Atari should work with this as is. I can use use CS-TeX under GEM or X windows just as easily.

4. Chimera fix - (1.36) The mintLIbs pl44 has a function to generate a unique name for a temporary file, unfortunately is uses backslashes for the filename. If the shell used to execute a command with this filename neeeds forward slashes or two backslashes for filenames (such as tcsh or the sh from MintOS 1.4.1) then you're won't be able to use an external viiewer. I patched it to used forward slashes always so if anyone (besides me) really needs this, let me know. There is a problem, though. When the viewer is called, the system() function is used and Chimera waits until the external viewer is exited before taking control again. You cannot run the external viewer in the background because the temporary file is deleted by CHimera as soon as it regains control. Anyway, when it gets back control it reports 'pexec - wait error' It doesn't cause any harm but it annoying. AS well, a second copy of the chimera process runs while the external viewer is running - this takes a lot of memory - does anyone know of a better more mint specific call to fix this (as opposed to the standrd system()) call?

5. I am currently working on Ghostview 1.5/Ghostscript and then maybe I'll take a crack at Motif and Xmosaic.

If there is enough interest for nonFPU/non68030 versions I will compile them as well. Most of these programs do require a fair bit of memory. (I think you can still run any on a 4 meg machine though)

Sam

  I'm fooling around with GBELL and need some information. Specifically,
what is the function of AES calls? I know that AES 90 is the file
selector, and 102 is close window, but what about the rest?

It is quite strange, because on F030 there is a lot of stuff expanding
size of screen and there are no problems with the mouse. All of them are
pathing only few XBios, AES and VDI traps. In my mind, you have to look
on some source of virtual screen for TT.

> GEM doesn't believe that I am running in 256 colours, unless I start up in TT-
LOW
> res. How can I fix this?

You have to make your own 'res-expander tool' (like BLOW-ACC on F030) and
you have to swich TT to 8k mode, then the tool will do other things...

> Also, what exactly do the transparent blit operations (vrt_cpyfm) do in
> transparent, XOR and reverse transparent modes? What do you do with the
background
> colour index in these modes?

In my mind all blitter operations are for single 1-bit plane. So all of
the modes are simply binary operations.

You should use "arrowfix", aviable in most FTP sites.

This *could* be the "double click bug". I think that's related to the 1.04
release. (There are fixes for that :-)

What OS have you got?

Does anybody have any source that will given a filename and a search criteria
tell with that filename meets the search criteria?

For example

*.DAT will meet the filename FRED.DAT
or
HELLO?.TXT will meet the filename HELLO1.TXT

Similar to Fsfirst DOS functions, but just want the C source?

Any help would be most greatful! 8)

I think it's in pub/Atari/Mint
Then you need to set up mint+mintnet, and finally X11

I'm pretty sure you need to run 'twm' or another window manager. However when I run twm from either the default shell - or the xterm I start from .xconfig - twm just compains about colours - and runs white on white. It does run though and starts up other programs. I don't know twn enough to do anything useful 'blind'!

You can also use VDI call v_pmarker() if you first set the markertype to
a single pixel with VDI call vsm_type(handle,type). Type should be MRKR_DOT (1)
With v_pmarker you may set many pixels at the same time.

Tomas :)

j> This *could* be the "double click bug". I think that's related to the 1.04
j> release. (There are fixes for that :-)

It's not only 1.04's problem. My Falcon with TOS 4.04 does also that
with programs I have written. I think the guy who asked about this
wanted to know how he could eliminate this problem in his own code.
I would like to know this too, it's very annoying. Fortunately
it doesn't occur with MultiTOS ;-).

Alex Nicholls (A.I.Nicholls@herts.ac.uk) wrote:
: Does anybody have any source that will given a filename and a search criteria
: tell with that filename meets the search criteria?

Just use fsfirst()/fsnext(). I don't know where you can get source, but
you could do a similar thing by something like:

call fsfirst() with *.*

check if this matches criteria. If yes then return with filename
If no, then keep going

call fsnext() with *.*
Does it match criteria? Yes? return filename
No, loop back to fsnext()

Or something like that. As for actually checking if each filename matches criteria, you would want to make up a function to get chars from any point in a string. Then just see if all the chars which are specified in the criteria match. If they do then you got a match. You could ignore `?' and `*' chars.

You probably thought of all that anyhow, but never mind,

In <3inli1$gtv@prime.mdata.fi> you (Arto Jalkanen) wrote :

>How can I check if printer is connected?

The way to do it, is to check if you can output to the parallel port, by doing this:

If you have GFA basic:
r!=bios(7,0)
r!=out?(0)

r!=true if you can output to the printer - i.e. it's not busy, and there is something connected to the parallel port.

With C, or pretty much anything else:
long status;
status=Bcostat(0);

status=0 if not ready (i.e. busy, or nothing connected), else non-zero.

By the way - the 0 in all of those calls means "parallel printer port",
you can use the following instead for other ports:

0 Parallel port
1 Serial port
2 Console device
3 MIDI port
4 Keyboard port (IKBD)
5 Raw screen device

Hope that this helps,
Richard =8-]

I ported NetPBM (I think it was one version behind the latest, which is
March '94) to MiNT a while back; I'd do a much nicer version (a "merged"
binary, if you've read the NetPBM docs) if I had more RAM. Shared
libraries would be nice, too.

Anway, my port of NetPBM is on atari.archive.umich.edu and mirrors in
Mint/Graphics/Netpbm/* or something like that. There's plain 68k
versions, and 680x0 (x >= 2) w/FPU if I remember correctly.

xmkmf isn't really needed; you can usually create a proper Makefile by
hand. I know this because our systems at work are not set up properly,
and xmkmf fails miserably.

I am looking for anyone from the ST_CLUB in England.

E-Mail address: stclub@cix.compulink.co.uk

I have just received an update to 3D-Calc from 2.?? to 3.04, and I
am having some problems with some functions.

Hisoft gave me this E-Mail address and informed me that they now support
3D-Calc, if this is true I hope they can help.

The problems I am having are as follows:

When an area is defined for "HIDE", "PROTECT", "ITALIC", etc. and the
"Set Attrabutes" is selected and "OK" is clicked, the area defined is
cleared of all data in the defined area, this is NOT GOOD! I use this
for my bookkeeping for a small business.

When you try to remove the any of the "Atrrabutes" the same thing
happens.

Also the "Merge file" functions does nothing!

Is there something I am doing wrong?
Is this the latest version?
Can I get an older version that WORKS!!?

Is there a program to convert 3D-Calc files to Lotus 123, any version?

I really need to get this corrected if possable or move the files to
another program if possable.

Please responed with E-Mail to the address below.

Thank you for any help.

|> Hi,
|>
|> I'm sure this question has been asked a hundred times already, but here
|> goes. Does anybody have assembly source to change the video-res on the
|> Falcon, and to change it back again at the end of my program? advTHANKSance

Yeh, its easy .... (when you know how!)

Use XBIOS 88 (- Vsetmode). Pass a word parameter to it on the stack. The value is encoded in the following way....

F S O P V 8 N N N

where F=vertical rez flag (interlace/double line =1)
S=st-compatibility mode
O=overscan
P=Pal or NTSC mode
V=VGA mode
8=80 column mode
N=number of bits per pixel.... (000=1, 001=2, 010=4, 011=8, 100=16)

A value of -1 returns the current mode.

You can also do it with setscreen. Pass a value of 3 in res (IIRC), and have an extra word which contains the Modecode (as above).

If you want to get higher resolutions than this, you will have to change the video-regs. directly. You could do this using the .FV (v2) file standard. If so, check out Falclib 5. (cannot remember where I got it....)

Hope this helps....

Anthony

: Use XBIOS 88 (- Vsetmode). Pass a word parameter to it on the stack. The value
: is encoded in the following way....

Well, in the codes I've made on Falcon, I intended to use the XBIOS 5 and 88, but I never managed to make them work correctly, so I made direct accesses to the 24 video registers, which provides a full control for the resolution you want, (for instance, reducing the scanned area can be quite nice when you want to ssaave some time), and it seems that it worked on almost every machine (Though I've been reported some cases where early F030s couldn't run my programs).

I think I've still got them somewhere on a disk. In short, these registers allow to set the size of the virtual screen, the size of the scanfield and the interlacing or double-lining (plus one or two other things), I'll check out.

I am looking for books to rach me how to programme the ST, but mainly the Falcon.

Any offers?

Please note I would prefer them to come from the UK.

Rod

Well has anyone written a program that uses the menu, and form dialogues from
Enhanced GEM?

I've been trying to understand the source code DIALDEMO and translated a bit
of it, but it doesn't have that many comments for me to fully comprehend
how it works!

Any source or help (or better still an readable manual 8)

If you're programming an application, there is a way to get around this
without using arrowfix. It has to do with setting up a certain AES event

and forcing this event BEFORE you enter the main event loop.
Unfortunately, I can't remember what the trick is. Perhaps someone
following this thread will know and followup. Apparantly this bug is
caused by an improper AES initialization.

I see (from a later post) that you have solved this problem, but I have a
similar
query....

I'm working on the Falcon, and have set up the buffers and connected everything
using the XBIOS commands, but it does not seem to stop when it reaches the end
of the buffer... I can manually stop it, of course.

Do I have to use one of the interupts to detect the end of the sample, and then
set bufferoper(0) to stop it? Surely the OS should stop when it reaches the end
of the buffer...

Cheers,

Anthony

Not got ones of those - though I've got a .twmrc ISTR.

The problem was actually a lack of Xcrms.txt(sp). I had a lowercase x at
the front instead.

Howdy, gang. I've pretty much finished a spiffy new MOD player. It
runs as a PRG or ACC, has the _coolest_ 3D look interface, and (coolest
of all) automatically scans any floppy you put in the drive and loads
any .MODs it contains with no need for the user to even have the
ACC open. Unfortuneately I have run into one /small/ problem.

I have _NO_ idea how to play a .MOD. Oops?

So, anyways, can anyone direct me to PD or at least cheap DSP .MODS playing source? Thanks.

Hmm...

I believe the solution to the infamous 'double click bug' is to arrange
a timer event of length 0. Since the length is 0, it does not delay your
program: but somehow it rectifies this rather annoying bug.

I think it's just a simple evnt_timer(0) call.

I certainly hope so! This is crazy, to say the least. OK, for only a few pixels it's all right, but what if I wanted to plot, say, a fractal (and still impress my friends with it)? I didn't want to use the BGI because I thought it could be done faster...

Am I correct that Line-A isn't even available on the Falcon TOS anymore? If it is, I _will_ use it (boo hiss!), if it isn't, I'll have to write my own putpixel(x,y) in assembly... Jeez...

Regards,

Hi !

This is really easy. What you have to do is to add the values of each samples and then to divide the result by the number of samples (To get a result in the range of values the Falcon can play). Just remember to make signed ops (because the falcon samples are always signed) and to use 32 bits for the result of the addition (because it may be greater than 32767). A good way to make the division is to use a right logical shift (wich is the same as divided a number by 2 and is quite faster (even on the DSP which miss a real div operation)) (I guess you already knew that).

The Falcon call is useless for what you wanna do because you may play only ONE track at the same time with the internal speaker, the jack or the TV. It is not a call to mix samples but to play several samples at the same time trough a special hardware extension in the DSP port. I don't know if there is actually one in existence. If someone know please tell me.

That's all ! Good luck !

I've managed to create a minix partition on a disk in Drive A (just testing) and I've messed around with 'mfsconf' for filename translations but I can't get long filenames. I want to install MintNET and possibly X on my Falcon but I don't think I can without a Minix partition.

I think I maybe using the wrong versions of ls, cp, mv, etc. I'm using those found in fu2-bin.zoo as found at umich.

Can someone e-mail me so that I can discuss the problems I'm having.

Try using v_pmarker() and setting the marker type (vsm_type() ?) to a
single dot.

Hi !

If you want to draw a Fractal at the maximum speed, here is
what you'll have to do :
- Allocate enough memory to store your picture
- Compute the fractal in chunky format (means one byte one pixel (or
  two bytes one pixel or ... well you understood))
- Convert your picture in VDI format with a quick assembler rout.
  (You can also directly compute it in VDI format but I think the way
  it is coded is not optimized for directly generate pictures (For
  those who know the amiga, they have the same problem :))
- Convert your picture in device dependent mode with vr_trnfm.
- Display it in a window with v-I-don't-remember-its-name.

If you wants to display your fractal while you are computing
it you can compute it line by line.

If you want to display only few pixels then use the line trick
but if you have to modify a big surface my way is the fastest.

Good luck !

OK, I'll try again...

Does anyone want any of these Atari programming books? They are
just sitting on my bookshelp collecting dust so they might as
well be doing someone else some good.

Send me an offer for the lot, with postage, if you are interested.
Better restrict this to the continental US, however, as shipping
would be rather dear across the pond, I imagine.

That's right. I remember reading somewhere `official' that this is guaranteed to be the fastest solution (at least a lot better than the v_pline solution).  We should probably interpret this as `every well-designed GDOS driver has a separate, optimized routine for polymarkers of type dot, size 1'.

I am looking for programs which will help me write GRM interfaced based programs.

Any idea where I can get them from.

Also what library/include file in Sobozon contains the GEM stuff?

Rod

I was told that the trick is to do an event_multi that waits for a double
click and also a 0ms timer event. This will drop through almost immediately,
of course. You need to do this once, just after appl_init.

I can't vouch for the reliability of this, since I've never seen the double-
scroll problem. Apparently it's mostly present on TOS >2.00

: running through maybe hundreds of other processes - with the interupts
: disabled.

: Does this convince you that preempting interrupt handlers is bad?
: And therefore that MiNT will probably never preempt supervisor mode?

As a matter of fact it doesn't. The documentation says that if you switch to
supervisor mode either by using super() or supexec(), the multitasking will
stop, and continue when supervisor mode is left.

: can set the number of tracks that will be used, but I haven't seen one
: for playing on a certain track, so I assume this would be done through
: software somehow....Any tips, or source?

To mix two samples together you just take one value from the first sample
and add it to the corresponding value in the second sample, and the divide
it by two. To add three samples you add the three values, and divide by
three, etc.

The Falcon only has two outputs for sound, left and right. Thus you can only
play two channels at one time. By mixing the samples you can make it sound
like there are more channels, but unless you mix 8-bit samples and play it
in 16-bit mode, you will get a loss of quality.

Hmmm... Well, the BiMaster of BTM (or something like that...) code is part of the assembler library FALCLIB ..... It has a couple of bugs though, and relies on a pre-assembled kernel....

Or, if your feel like doing something special, you could check out the (again assembler) fast_dtm code. This is Jaccard Emmanuels DTM player code.

Both of these are available over FTP from falcon/programming directories on most ftp sites (cnam.fr has them IIRC)

Hope this helps.

Anthony

Hi,

In reply on your posting to comp.sys.atari.programmer....

>I've managed to create a minix partition on a disk in Drive A (just testing)

My system is currently running with Mint 1.12 minixfs pl 6.10 (or about that). It works perfectly, though one should watch out with resetting the computer a bit too easily, minixfs uses delayed writes, you see.

>I want to install MintNET and possibly X on my Falcon but I don't think
>I can without a Minix partition.

Do think so...

>I think I maybe using the wrong versions of ls, cp, mv, etc. I'm using
>those found in fu2-bin.zoo as found at umich.

I'm using the ls etc. from some old futil-bin.zoo (or tar.gz or
whatever). They work quite well for me. There's also a MiNT version of
TeraDesk which I use. It displays the long filenames etc. The
availability on the net is quite poor I think, perhaps on ftp.funet.fi, I
once uploaded it there, didn't see it on atari.archive.umich.edu yet.

Hope this is a bit of help to you....

But that requires that the trap is reentrant, wich is *not* the case
for the GEMDOS and AES in the ROM, and even the BIOS and XBIOS is not
good at reentrancy. This is the price for not having to rewrite the
whole TOS.

On almost every machine, but not every monitor....

RGB/TV need different settings to VGA for the same resolution. Dont use these,
unless
you can test on both....

Also, VGA, I believe cannot cope with some settings that work on SVGA...

Use XBIOS 88 unless you need to get a non-standard resolution. (If anyone
wants
assembler code to switch res using XBIOS, I can send it to you....)

```

If you want a fast putpixel, code your own routine rather than relying on the os to do it for you. You would need to do a different routine for every resolution that you want to support, but the speedup is remarkable.

Get a pointer to the video memory by calling Logbase(). Then write directly to this memory. In ST-High (mono, 640x400) this is just a bit array, so use something like

```
char *screen = Logbase();

void putpixel (int x, int  y)
{
   screen[(y * 80) + (x >> 3)] |= (x & 7);
}
```

I think that is right, although I haven't actually tested it.

Other resolutions are similar, although you have to handle several
different bit planes in the color modes.

Here's a bit of C-code that does the trick. Hope you're able to read it and
transform it to GFA...
Important note: have the new buffer italled as short as possible -- i.e.
have all your MIDI I/O enclosed in a structure like

```
  new_buf();
  midi_io();
  old_buf();

/* -------------------  MIDI BUFFERS  ---------------------------- */

long *midibuf_init( void )
/* Only called once, at the beginning of the program.  Sets the (global)
   pointer 'newbuf' to point at a newly malloc'ed buffer of appropriate
   size.  Also sets the global variables 'oldbuf' and 'oldsiz'.
   In case of failure, NULL is returned.  In case of success the address
```

```
   of the new buffer is returned
*/
{
     oldbuf = Iorec(2)->ibuf;     /* old midi-buffer address */
     oldsiz = Iorec(2)->ibufsiz;  /* and size */

     newbuf = (long *) malloc(BUFSIZE);
     return newbuf;
}

void new_buf( void )
/* install new (larger) MIDI buffer */
{
     Iorec(2)->ibuf=newbuf;
     Iorec(2)->ibufsiz=BUFSIZE;
     Iorec(2)->ibufhd=0;
}

void old_buf( void )
/* re-install the old system-MIDI-buffer */
{
     Iorec(2)->ibuf=oldbuf;
     Iorec(2)->ibufsiz=oldsiz;

[Author was Sebastian Tkocz]
[Posted on 17 Feb 1995 08:30:14 GMT]

So, is there any PD/SW csross assembler, that I could use to test HC11 code
on my MEGA ST2 ?
Or is there perhaps a HC11 simulator ?

No, it is an error. Padding bytes get automatically added by the
compiler and there's usually not much the programmer can do about it.

The declarations are probably meant to be 'void *', but as I don't
have MagiC I cannot check it.

What is the structure used for anyway?

I tried to get hold of the falcon dev. doc.s a while ago, and after I
pestered Atari for a while, they recommended that I contact HiSoft, get
DevpacDSP and the Atari Compendium (I was NOT impressed). Apparently
they've not got any Falcon dev. doc.s left !?!

Still DevpacDSP works, and once you realise that some of the Atari
Compendium is copied straight from the Falcon Dev. Doc.s and therefore

contains the same mistakes, it's what you need (just more damn
expensive).

In fact it is documented (somewhere :-)) that MiNT will not pre-empt a
task running in supervisor mode, and that is not something that's ever
going to change.

Going to IPL 7 for anything more than a few instructions is generally not
a good idea -- it means that not only are task switches not going to happen,
but keyboard and modem input are going to be lost!

It should be in Dave Baggett's picture format list,
(ftp to src.doc.ic.ac.uk : /packages/atari/Graphics/picfmts.doc)
and ST Applications magazine ran a Programmer's Forum series on it a
couple of years ago.

>and in particular how to write a file in this format using GFA basic.

Probably the simplist way (if you have GDOS or a clone) is to open
a physical workstation to the metafile driver (31), then use VDI calls
to draw your picture. (I _think_ this is possible in GFA.)
The driver will create a file called GEMFILE.GEM which is your metafile.
This way means you don't have to know anything about the metafile format.

I can get xinit to run, but then all I see when I run it is an xterm window
(at least I assume it's xterm) which I can't move. And I can't figure out
how to run an extra xterm in a diff window on a different place on the
screen.

Chris, the structure points various key memory locations and structures used by MagiC. However, all of the same (necessary) variables and structures pointed to by this structure are also pointed to by documented "official Atari" pointers. So, the structure listed is redundant. I believe this redundant structure was created to access extended features (in the future) and other MagiC specific info (like date of creation etc.).

The structure points to the AES variable table, OS variable table, memory management tables (different than TOS)l, etv_critic handler, shell driver, VDI driver, etc.

As far as the structure being (incorrect). Perhaps in syntax with C, but considering I use GfA Basic and assembler, it makes perfect sense to me. It's real easy to use.

Also, as to syntax, could it be another "dialect" of C? Remember, Mag!X/MagiC was written in Germany, and who knows which "C" they used for reference.

Anyway, I wish him luck. MagiC is a darn good OS.

Why? I rather say that it would be highly likely to do such a change. At least if you want several threads in the kernal running.

Instead of blowing smoke up a tree and pushing a product...

Here's a direct answer:

The memory address for Mega STE Cache and Processor control is 00FF8E20
and is a BYTE wide register.

The following table indicates the values to set and their meanings:

Value HEX	Decimal	Meaning
FF	255	16MHz with cache ON
FE	254	16MHz with cache OFF
F4	244	8MHz no cache (Normal ST mode)

I hope that helps

Unfortunately there are too many differences in the standard ST
resolutions to make a resolution independent resource file. First, low
rez has too few pixel real estate to make a decent dialog box and menu
line. Second, medium rez has a weird elogated pixel screen to make
vertical positioning a nightmare. My advice is to ALWAYS use a special
RCS file for low resolution (you have to abreviate the crud out of things
to make them fit). You can create a standard file for medium rez and up,
but in order for it to look presentable you must create the file in
medium rez. However, on higher resolutions the verticle positioning will
be off and things will look widely spaced. So, leave low rez to games
and make two RCS files. One for medium and another for other resolutions
like ST high, TT and Falcon modes. Create the resource in a monochrome
mode and once it's created go to a color mode (if you have a TT or

Falcon) and "pretty" it up and go back to the monochrome mode to see if it still looks ok.

If you must have low rez, then frankly a minimum of three files are necessary one for low, one for medium, and the last for ST high, TT, and Falcon modes. OR ... you could include all three in one RCS file (as long as it doesn't exceed 64K). Sure, this approach is lame, but it's the only solution I have been able to find that doesn't make the dialog boxes "cheesey" looking.

Good luck!

Rich

To be precise, the ST Applications coverage was 3 articles in the summer of 91, issues 7, 8 and 9 of the mag. Full description of the format and C source for a program to decode metafiles.

Hi,

Does anyone know how to let the AES know about changes in resolution ?

I am trying to make a Blow-up software type program.

Cheers,
Phil.

There's a new version of picfmts.doc around which now covers the XIMG format. I've converted it all into an ST-Guide hypertext which I shall upload to hensa ASAP.

I'm also trying to gather information for revising the .GEM format section as well, so that it covers Speedo calls as well as the metafile escapes.

Help!

I have a problem! I bought the C-compiler Pure C, but now I'm not able to use the graphical stuff of the Atari. Pure C allows to use RSC's, but that's all. It has an own BGI (Borland Graphical Interface), so that on all Borland-compilers the same graphical functions can be used, but it is too restricted.

How can I just draw a line on the screen, not having to use RSC's, and still use my mouse-pointer? I'd like to write programs like in GFA-Basic, but then a little faster, but I can't manage it!

Does the Megamax-C-compiler have the same problems? Do I have to buy it?

Greetings,

Koen.

I want to implement (write) a simple piece of netoworking software which will allow the Network port on the Falcon to be used. The software will allow the connection of any RS type device to the F030 network port and will run in the background and allow access to disks, printers etc.

Does anyone know of the existence of any documentation on the net that covers this.

Rod

where's the vector for scan codes from the ikbd?
I've got documentation (kbdvbase) for mouse packets,
joystick data, midi, clocks, but basic key presses?

My software provides the severely disabled with access
to TOS machines, and I'm now providing an alternative
keyboard access - only I can't emulate the keyboard key
presses.

Any info would be extremely useful.

Thanks,

Anthony Aldridge

In article <Pine.LNX.3.91.950217202007.2148A-100000@raven.cybercom.com>, Doctor Zweistein <drz@raven.cybercom.com> writes:
>I can get xinit to run, but then all I see when I run it is an xterm window
>(at least I assume it's xterm) which I can't move. And I can't figure out
>how to run an extra xterm in a diff window on a different place on the
>screen.
>

You need to have twm run as the last thing in your .xinitrc file in your home directory.

Example .xinitrc

```
# Fix the keymap for QWERTY
xvt -ls /usr/local/bin/X11/xmodmap /etc/ukXkbd.map
# Run a shell to be ready for commands.
xvt -ls -n Craig1 /bin/sh &
# Run TWM to manage the windows.
twm
```

You also need a .twmrc file in your home directory to configure twm to how you like it.

Craig.

I've set up a buffer for sample playing and it works fine, but when I want to
change the buffer to start playing from somewhere else in the memory before
the old one has finished the new one can't be heard.

How do I make the old sample stop playing so I can play the new one instead?

Hi,

A friend of mine wants to set up a slip connection with an
InterNet provider. His home computer is an Atari-ST 1040.
Is SLIP software available for the AtariST, or any other
Atari line (like the Ste)?

I checked atari.archive.umich.edu, and notably the communication
area, but couldn't find it.

Thanks in advance for pointers,

Jan van der Steen

I wound up with Cubase 3.0 disks and the dongle, but no
Manuals, when a partnership broke up. Don't have much
use for it, but the dongles the important part. So it'd be a working
version of Cubase 3.0, but you'd have to get manuals elsewhere,
or figure it out yourself. Make me an offer if you are interested.

A whole stack of Dr T's for sale!

KCS Omega LEvel II, with Tiger, Quick Score and Song Editor, and PVG,
     for algorithmic composition. It includes KCS 3.0.
     I also have previous versions of KCS
XoR universal Librarian/editor, with a fair amount of profiles, including

some of the MOTU profiles they wrote for it.
Copyist notation software - multiple versions
all docs and discs.

This is all for the Atari ST

Make me an offer if you are interested. I'm not shipping out of the country...too much hassle.

Lo,

I have got an atari portfolio with ram 128ko

1) can i upgrade the ram, by myself ? and how ?
2) is there an ftp site with programs for the portfolio ?

Bye, gael.

Hi all !!

For all who waited for a possibility to conect their Ethernetcard from
PAM's (Germany), here is the solution:

Torsten Lang and I made some changes in the Riebel card software from the
University of Vienna. It is now possible to use it with PAM's VME and
EMega Ethernet card. Further information: See the readme file.

The software was uploaded to fortec.tuwien.ac.at in Vienna/Austria.
It should appear in Munich as well.

For further infomation email me (address below) or
torsten.lang@physik.uni-giessen.de directly.

Have fun !

Martin

How about opening a virtual workstation (v_opnvwk), and then using vdi functions to do the required drawing. Take a look in the PC-help file. Look e.g. at Libraries/VDI/* .
And you might like to invest in a good Atari book. The Atari Profibuch is excellent (also translated in Dutch: het complete Atari ST boek).

Does anybody have a program to convert between GNU, GST and DRI library file types? If not, does anybody have or know where I can get file formats for these files? I am aware of a DRI->GNU convertor, but I want to convert GNU and GST types to DRI.

Any help would be appreciated. Thanks.

>But using this command doesn't seem to be enough. Any better ideas or tips?

ST-Low and ST-Medium use 8x8 characters, and *all*other* resolutions use 8x16 characters.

Thus, for true resolution-indepenace, you practically need to make 8x8 RSC and an 8x16 RSC and use 8x16 unless the resolution is < 640x400.

Another thing you could do is roll your own rsrc_obfix() that also takes the resolution the RSC was created in (like rsrc_obfix(blah, 8, 16)) and makes appropriate fixes. Warwick's GEM++ library does this automagically when you load a RSC file (since he's got a custom RSC loader, which also gives you the ability to have more than one RSC file loaded).

Colin, you can use BARRELL or REDIRECT. I think both of them are available for ftp various places. Having a deskjet, I don't worry about it so I don't know where to look, sorry.

What type of system are you using? In the DMA sound system you
just need to set the bit for play_enable to 0. On the Falcon, just off
the top of my head, I believe its just Buffoper(0). Make any sense? If
you need any more help just let me know.

Hey all,

I downloaded the source for Chimera for X11R5 but I am I nowhere near
having it compiled. I haven't yet compiled anything sucessfully bacause
every single version of gcc I've tried (with anything, not just Chimera)
gives me bus errors. Anyway, is NETPBM or PBMplus alreasdy compiled
for the atari? The source distribution includes files for coverting
Degas and Spectrum pictures so I assume some atari user has already got
those tools compiled.

As well, it seems that Chimera (BTW, for those who don't know Chimera
is a graphical WEB browser for X11 that doesn't need motif) requires
a utility called xmkmf, which I assume is a make utility of X based systems,
and all its makefiles are called Imakefile. I really don't know

what I'm doing so if anyone has any suggestions for me they would
be greatly appreciated - if anyone really knows what they're doing
compiling X/network applications maybe you could e-mail me.

Thanks,
Sam

Have a look in the Network/ directory! :-) There are a couple of major
flavours for SLIP. Have a look at NOS or MiNT-net. If your friend has
still only 1Mb RAM in the machine, MiNT-net probably won't run.

Sadly its not _just_ the mouse that doesn't work on the Falcon, there are many pitfalls with STOS on the Falcon (for example any command that requires Line-A useage - ie box!), also the joystick commands don't work,

change mouse doesn't work, the compiler needs playing with and in the long run its hell. But I spent hours setting my system up right and STOS now works on it faultlessly, if anyone wants the patch programs or extensions that make STOSing on the Falcon possible then mail me and I'll see what I can do.

We are looking for someone with major experience in programming on the Atari Falcon 030. Ideally, you will know how to program the BLiTTER and DSP and have experience in both C and assembler.

If you have access to the World Wide Web, you can read about our product at www.tecnation.com/tecnation/

Click on OUR PRODUCTS and then click on SONOVISTA.

If you are interested, please contact us at:

DEPT: BiT BOPPER
TECNATION DIGITAL WORLD
555 BRYANT STREET #257
PALO ALTO, CA 94301, U.S.A.

FAX: (415) 327-4332
EMAIL: work@tecnation.com

Sorry if it's wrong to post this kind of thing on this newsgroup, but we don't know where else to post it.

Hi Phil !

So you want to make a Blow-up type software. I know that you will need to patch a lot of line-A vars (Yes you will have to use the line-A !). When you initialize the line-A it send you the address of an array wich contains its vars. So you will have to them to make system aware of your res changes. I hope you own a copy of the Atari compendium, wich details this array. I don't know if this will be enough, but this is a good beginning.

Good luck !

Does anyone know the technique for mixing samples (Falcon, or I suppose STe would be fine also)? I know there is a call on the Falcon where you can set the number of tracks that will be used, but I haven't seen one for playing on a certain track, so I assume this would be done through

software somehow....Any tips, or source?

thanks,
Russ

Hmm.. Allthough there is a get_pixel function in VDI, there is no reverse
to that function. If you must use VDI you could draw a very short line using
v_pline.

To be precise, drawing a line using the same point as starting and
ending point should work. For example:

```
void put_pixel (int x, int y)
{
  int pxyarray[4];

  pxyarray[0] = x;
  pxyarray[1] = y;
  pxyarray[2] = x;
  pxyarray[3] = y;
  v_pline (vhandle, 2, pxyarray); /* not sure about order of args */
}
```

Because by its very nature an interrupt implies something must be done _now_.
Not in a minute when the kernel feels like giving the handler more time.
For example, you have a device sending data at highspeed. When data arrives
an interupt signal is given - the interrupt handler is _immediately_ run
to transfer data from the source to memory. If MiNT preempts the handler
then chances are that more data will arrive before the last has been
cleared from the i/o buffer - result - lost data. COnsider also that
most interrupts require that other interrupts be disabled while they are
running - if the handler is pre-empted then there if the chance of MiNT
running through maybe hundreds of other processes - with the interupts
disabled.

Does this convince you that preempting interrupt handlers is bad?
And therefore that MiNT will probably never preempt supervisor mode?

Good morning.

I'm looking for documentation of the -mbaserel option in the newer Atari
versions of GCC. I only found some rather old docs on atari.archive,
which didn't mention this option.

Thanks in advance,

     Jens.

Hi atari-freaks,

I'm searching for a recalibrating-tool for RLL/MFM-Harddisks,
like under Norton Utilities for the PC.

??
greetings Joerg

Well its the TU-Wien stuff I'm working from. I have 1 .IMG file and 3(?)
.HP files full of plotter commands. Although I have no use for the
software, the newest version of MiNT-Net apparently has a driver for a
DE600 using the TU-Wien interface board.

Today I tried a sharware package (PRINTGL) on my PC which can display the
.HP files, and they are indeed the PCB masters that I thought they were,
plus the original circuit diagram which is also in the .IMG file. There
is also a block diagram (in a .HP file) which shows which chips plug where.

I'm still interested in speaking to anybody who has built this board,
especially if they can sell me a pre-made PCB.

> PS: There is ka9q giving SLIP for the ST, but is there a PPP package
> ? I didn't get the SLIP on my unix machine to work at all...

I though KA9Q did this anyway. And also MiNT-Net does PPP AFAIK (though
I'm using CSLIP).

:-)

Roland.

Thats expensive. I'm sure I've bought them *new* less than that! I think
my company might be prepared to part with one for a small fee if I ask them
nicely. We did use them alot, but now use DE620s and Longshines.

> The PCB's are available as HP plotter files from fortec.tuwien.ac.at.

Thanks - I've found something on the PC which seems to do the job as well.

> You could ask Peter Mayr (pm@fortec.tuwien.ac.at), the author of the

Will do.

Which is why I'm interested! :-)

Anybody going to do a driver for Linux/68K for this board as well? It would make sense to have this as a standard.

:-)

Roland.

There's also some metafile stuff in the early issues of ST
Applications.

Rolling your own code is of course necessary if you want to run on
setups without GDOS installed. But frankly, everyone should get a good
GDOS: NVDI 3 or Speedo 5.

A corrected version of JAS can be found at

ftp.cs.tu-berlin.de

in

/pub/atari/Programming/Sozobon.c/jas2x9.lzh

BUT: We've just discovered a very nasty bug in the Xdlibs strtoul() routine that causes JAS to behave in rather strange ways when reading large numerical constants (hexadecimal).

I'll upload a new version linked with a working strtoul() as soon as possible (probably tomorrow), so make sure when FTPing jas2x9.lzh, that it is newer than say 25th January '95.

Until then, best thing is to use an older JAS together with TOP.

Sorry,
-tr

Hello,
u can have the (original) Atari Ethernet Cards for 300 DM ($150). They for
the VME-Bus and without software.

greetings Gunther

Whoever needed the arrow reading code, here is what BIX (Byte, Feb or

Mar 87, can't remember now) says:

Solution 1: Cconin/Crawin return long, the low word is ASCII value,
the high is 0, but for arrows, low is 0 and high is
stuff like 4C and other arrow codes.

Solution 2: The following C function:

```
char rawread(int *code)
{
 char c;

 asm{ move.w #7, -(sp)
      trap   #1
      addq.1 #2, sp
      move.b d0, c
      swap   d0
      move.w d0, (code)
    }
 return(code);
}
```

I just got my 1040ST at a junk sale and have no software, so can not
verify.

>Yeah, but how do you do that?

I use 3 routines I've written to do 'page flipping' as the good Doctor prescribed. These routines are generic (for ST resolutions) so you can just merge them into your programs and use them with little fuss. Of course, you can optimize them for your own use. They may need some slight modification for use with GFA 2.0, though.

These were published in a great little book called 'The GFA BASIC Toolkit' which was written and compiled by a nice guy whose only fault is his undue modesty. :) The book is now out of print but you are free to use these routines. And NO nit-picking from you 'GFA gurus' out there! The price is right, after all. :)

Page Flipping Routines for GFA BASIC
==========
Use: Call the alt_screen procedure once, early in your program to reserve space for one or more background video screens. Use the set_screen procedure to modify a hidden background screen and when finished, "pop" it to the foreground with the copy_screen procedure. For example:

```
  setup_alt_screen          ! create a background screen
  set_screen(scr1%,scr0%)       ! draw on scr 1, view scr 0
  BOX 100,50,200,100            ! draw something in the background
  copy_screen(scr1%,scr0%)      ! pop the background to the foreground
  set_screen(scr0%,scr0%)       ! reset draw & view scr to be the same

PROCEDURE setup_alt_screen
  ' Call this routine once to prepare an alternate, background screen.
  scr0%=XBIOS(2)            ! adr of physical screen
  scr1$=SPACE$(32256)           ! reserve some space
  scr1%=V:scr1$                 ! adr of background screen
```

```
RETURN
'
PROCEDURE set_scrn(draw%,see%)
  ' Use this routine to direct video output to one screen address, while
  ' accepting graphics input to another screen address. This routine allows
  ' you to draw on a hidden screen while viewing another in the foreground.
  '   draw%   the adr of screen to send all graphics commands
  '   see%    the adr of screen to send video output
  VOID XBIOS(5,L:draw%,L:see%,-1)
RETURN
'
PROCEDURE copy_screen(from%,to%)
  ' Use this routine to copy screen data from one screen address to another.
  BMOVE from%,to%,32000
RETURN
```

: : A much faster way of doing this is to switch the logical and the
physical
: : address. That way you only move a couple of bytes (and it isn't dependent
: : on the screensize).

: I tried doing this -- swapping physbase with logbase, but it doesn't seem to
: work for me. Could you post an example? It would seriously speed up some
: routines I use.

From what I remember, it's something like this:

```
log%=something on a 256-byte boundary
phy%=something else on a 256-byte boundary
DO
  update_screen
  VOID XBIOS(5,log%,phy%,L:-1)
  SWAP log%,phy%
LOOP
```

That's 256 bytes - $ff98fc is a longword, therefore uses fc,fd,fe&ff - that's
256 - I think you forgot to include $ff98fc. I can't help with the other
stuff though, sorry.

Summary: Can't get regexp to work
X-Newsreader: TIN [version 1.2 PL2]

I have gnu c 2.5.8 and cannot seem to get to make regular expressions work.

Whenever I use the functions regexec and regcomp, it compiles ok, but keeps
on saying it can't find a reference to _regerror.

Any ideas?

Looks like that was false alarm. That bug only appears in the yet to
be released x10 version of JAS. I'm sorry if I caused any confusion,
but this bug really bit me hard while working on the next c68 release.

Hi Karl, you said:

> I know there us no graphical WWW viewer for the ST but is there an editor?
> Failing that can someone reccommend some software to create HTML files on a
> pc?

There is no specific-HTML editor for the ST, but then again I think the existing HTML editors that exist are very restricting - and so resort to a simple text editor (Everest, say, or MicroEmacs) to edit my web pages.

Once you've understood HTML there is basically no problem in writing whole pages totally without WYSIWYG. At least, I can... and as long as you have access to an HTML viewer, such as Mosaic or Netscape on the PC, you'll be able to check them and then re-edit them there and then.

Hope that helps, Leon.

Hi,

Using Mark Williams C v3.0* and Atari STf 1040 expanded to 4Meg.

I've been having problems using fsel_input().

99% of the time I can load and save files no problem but every so often the computer bombs (variably 2 or 3 bombs) when I click on OK or hit <return> after having input or chosen my file. This happens even when loading a file is the very first thing I do upon entering the program. I can't track down this bug and it's driving me up the wall.

Any help or suggestions would be appreciated.

P.S. My file input and output function is almost code for code the exact one given as an example in the Mark Williams manual.

: 256 - I think you forgot to include $ff98fc. I can't help with the other
: stuff though, sorry.

No. The end address is $ff9bfc, there was just a confusion between the characters B and 8, I guess... The format of one color, as I already mailed to this guy, is four bytes, in the binary format:

RRRRRR.. GGGGGG.. ..... BBBBBB..

Where R, G and B are of course the red-green-blue values for the

color you want, between 0 and 63 (so they are multiplied by 4 when stored in this binary format). So when you got red, green and blue, the correct value is

```
     blue+256*(256*(green+256*red)), in a long word.

     Cheers :)

No, gemview will only turn it into another bitmap format. Turning the hpgl into another vector format such as .gem would be more useful.

As far as I can remember, you should use '$I+ at the start of the file

(flag to compiler) and $U+ / $U- when you actually use it. In my
experience, though, this GFA command is so bugged it is not worth
bothering with... :-/

In in the middle of touching up a game program (or 12) I am creating, and
thought it would be kewl to add mod music. And samples.
I know they are big, but man, much better sound. And I have several that
I have created over the years. Good tunes!

Also, any people using STOS 3d out there? If so, when you build an
object, how can you make its surfaces solid? Seems when objects rotate,
they become transparent in places, causing ugly colors to show from within!

Any help, code/source would be of great help!

Hi,

I managed to MiNT and term running nicely. My only problem is that the windows in TOSWin only do VT52, and lynx, pine, etc don't run in VT52. So the question is: Is there any way I can have these TOSWin windows do vT100? Myabe a proggie which I run which then in turn calls trsh (termshell) or something? Myabe something completely different? (But not X, I don't feel like installing that (yet).) advTHANKSance

Hm... so I should just drop, it, should I? Well, well. I was using it to display elapsed time once a second, but who cares about time these days anyway... :-)

Or do you know of any other commands I could use for this purpose?

Does anybody know how to turn of the Carrier Detect on a modem?

The problem is this: I wish to dial up a remote phone (not a modem), and, when the remote phone is answered, continue to transmit numbers (touch tone signals) to the remote phone. The remote phone is, as you may have guessed, answered by a machine.

> a machine.

Just add a ";" at the end of the dial-string and the modem will not try
to handshake, but will return to command-mode...

```
AT 123456;       will dial up and then give
OK

AT 123456        will now send the DTMF tones
```

To dial automatic pagers some modems have a voice detect-command

```
AT 123456 @ 123456 %  Dial pager 123456, wait for answer, send 123456
                      and wait for confirmation tone (the % command)
```

: In a program I'm making in GFA, I've used the EVERY command... however, when
: the program is compiled and run this command is totally ignored, even though
: it works perfectly fine when I run the program from the Interpreter.

: Any suggestions?

You need to put compiler directives in your program before compiling. The
directives are $I+ $U

For example, you'd do:

```
<code here>
$I+ $U
EVERY ticks GOSUB routine
<more code>
$I- $U
EVERY STOP      ! To turn it off
```

This is the same for the AFTER command.

I am writing a program where the RSC-file is about to tip over the 64k
mark. I understand from the Atari Compendium that this is a hard limit,
any larger and I will have to use the new RSC-file format. This would
make the program limited to the newest TOS versions, and so is
unacceptable to me...

Is there a way around this? (I have allready placed all large bitmap
icons and a lot of text strings, like alerts, outside the RSC...)

Does anybody know how the off screen bitmap support in SpeedoGDOS and eDVI works? I have managed to open & close a workstation with Speedo & MEMORY.SYS, but it allocates its own memory, witch is not what I want. I (ideally) want to:

1. Open a workstation to my own in-memory mono bitmap
2. Use this to modify (drawing VDI commands) the bitmap
3. Change adress/size to fit other bitmaps in memory
4. Close only at program termination

As an alternative to 3, I could have a workstation open to all bitmaps in memory, if possible.

I think this is available in some way in eDVI, a system enhancement embedded in NVDI, but the NVDI3 documentation is not very helpful...

Can anybody help? (no help in the GDOS.FAQ on this...)

Yup, I'm using the TIMER to time the elapsed time (so to speak...), but I used
the EVERY command to *display* the elapsed time on-screen once a second.

Save the resource as source code, and compile it as part of the
executable. No limits that way, sizewise. You _do_ have to access

Dancer
it a little differently, but a couple of new subroutines fixes that.

: icons and a lot of text strings, like alerts, outside the RSC...)

Split up the RSC-file into two, and then load the one you need. You can't
have two RSC-files loaded at the same time, so you'll have to remove the one
you're using from memory when you wish to load in the second RSC-file.

Its in the TT or MSTE you buy to upgrade from your STM ;-(

These cards sound quite good - but I reckon I can get a DE600 for about
the same price. The disadvantages is that a VME connection is better than
the DE600 parallel connection. The advantages is that there are supported
drivers for the DE600 (for MiNT-Net at least) and that a DE600 is of use in the
PC world so has some residual value.

Roland.

>Any help or suggestions would be appreciated.

Check that the size of the arrays for storing the path and file specs

are large enough. Any intermitant bug like this is probably because
under some circumtances your program code or data may be getting
trampled on.

>P.S. My file input and output function is almost code for code the
>exact one given as an example in the Mark Williams manual.

It shouldn't be too large so post it here if you like. It's always
easier to tell what's happening if one can see it! :-)

Cheers,
John

Hello everybody,

Sorry for the newbie question, but I have a course comping up next quarter
that requires programming the Motorola 68000 microprocessor, and I was
wondering if the Atari ST series used this as it's main CPU. (I seem to
remember it using one...) I'd much rather get an Atari than an old fishbowl
mac, so any help would be appreciated...

Many thanks,
rex

Hi.
I've got a friend who's actually coding a paint software on Falcon.
He needs a 68030 routine for GIF-depacking. If you got one, please E-mail me.

Cheers :)

Hi!
I'm trying to compile the pbmplus package on my falcon with gcc 2.x
Unfortunately, make doesn't work, so I have to figure out the file
dependencies myself :-/

But the actual problem is: How do I force gcc-compiled progs to write
binary data to stdout? If I run tgatoppm, the resulting raw ppm file
is corrupted, because every newline (\n) is replaced by CR+LF instead
of a single LF.
For example,
  tgatoppm color.tga > color.ppm
produces a corrupt ppm file.

My interim solution is a named file out.ppm, opened with
  ofp = fopen("out.ppm", "wb")
by tgatoppm. So
  tgatoppm color.tga
works, but this is only a hack.

Solutions, anyone?

Thanks in advance,
  Chris

Is there PD sources for pop-up menus? With pop-up menus I mean
those that come when you press a box. (to clarify more, I don't
mean heararchical menu structures)
    They are present from aes 3.30 onwards, but I want to
get them work with ST's too. And why re-invent the wheel
if someone has already done it?

Thanks,

You can also mail me: artoj@mits.mdata.fi

Better still write your own .rsc file loader (the Atari one make a poor job
of loaded .rsc files at different resolution anyway). Then you can load
as many .rsc files as you like. The basic code for loading a .rsc file
is included in Warwicks GEM++ library.

Or, use a RSC editor like Interface, which can save files in one of
the new formats. There is source code supplied with Interface which
you use instead of rsrc_load, and which loads the new RSC files on any
TOS.

To my mind, it is _NOT_ necessary to lock the screen and so on.
My Profibook, the german atari bible, does not say anything what you have
to care for. So, I guess, you don't have to care for anything (f.i.
locking the screen etc.)

Just take the disk and read it on the PC. The disk format is the same.
(Some clones will not be able to read some of the fancier formats,

though.)

This is not quite true! I run GFA Basic in 16 color 640x400 on falcon and
I think that it works with any 16 color or less mode. The graphical
instructions doesn't works in the intepreter with 256 color mode but if you
compile the program it will work fine!

Yes - just switch the processor to Supervisor mode - then MiNT won't pre-empt
you until you switch back to User mode.

I usually hide the mouse whenever I draw anything on screen, else the mouse
gets stuck in unwanted places. And of course show it again when im done.
If you are not painting more than one object (like graf_slidebox()) this
will be well in time of the next vertical scan.

/Jens

Ooopps It seems like I was a litle too fast.. :-)

The swedish doc Atari/hardfacts states that AES will hide the mouse for you
and show it again when ready, for functions like graf_growbox().

You will be fed up with GFA also, but not for the same reasons. ;-)

> GFA Basic quite cheap and was tempted to buy - except, does it work on
> the Falcon? I know that a few people are using GFA on the Falcon but are

GFA Basic works with Falcon straight without any fixes, but you have
to use ST-medium or ST-High.
        But if you ask me, get C ;-). GFA makes awful code. One of my
old programs that was coded in GFA Basic didn't work very correctly
on Falcon. But on the whole they have worked well enough...

Well, you don't said whether you have an atari STF or previous, or an STE or more. Since TOS 1.6 (STE), disks formatted with the desktop are PC MSDOS compatibles. If you have an older TOS version, format a blank disk in 720K format on PC and then copy the files you want to transfer on this formatted disk. You'll be able to read the disk with no more problems.

To get this diskformat-thing straight:

The ATARI will read any 720k DOS-format disk! (provided it has a doublesided drive)

The PC-Clone will *NOT* read disks formatted on *OLD* Ataries! (if you havn't got one of the clever formatters)

The MAC will *most probably* ONLY read disks it has formatted itself. Use PC Exchange to do this. This Apple-flavoured-DOS-disk-thingy can be read by all the other species...

So format using your Mac (if you have one), else use your PC-clone.

I am returning my Atari 800xl to service for an indefinite amount of time, and require some assistance getting caught up with the latest on them. If someone could send me a FAQ, it would be appreciated. Otherwise, I am interested in knowing any WWW or other sources for files and information, as well as info on anyone who may still be in the business of selling related hardware and software. Last I knew (now about 2 years back) BRE Software was still selling stuff...don`t know anymore.

Few simple questions as well:

I am running a 256k 800xl with an ATR8000. What is the fastest modem supported on this configuration these days?

When I last ran my BBS, I had seen some files out there to give a good 80 column display on the system. Anyone got anything that works well with communication software...I intend to use this system primarily to log into the internet and other local chat boards.

Thanks for any help. I have loads of stuff as well, as soon as I also temporarily return the old 8" floppy drives to service long enough to copy everything down to a 3.5in disk (hope I can get those suckers formatted beyond 720k...would like to format em to 1.44, but 720 k is better than 192k on a std drive...)

Thanks again in advance.

Disks formated with TOS1.4 (STFM) are also MSDOS Compatible.
Also, FCOPY III/Pro alows disks to be formatted as MSDOS compatible
if 9 traks, 80 sectors is chosen. I presume some other formatting programs
also have this feature.

I write lots of games programs for the ST (in STOS, but don't flame me for that!) - some are sharaware, others PD. I know that advertising is frowned upon on the Internet, I was wondering whether or not talking about games of mine on this group would constitute "Advertising", and so would not be allowed. Could I, for example, state on which archives my PD games could be found? (As yet, there are none).

Perhaps the charter owner for this group could post it, so that I could read it and clear this up? Thanks,

Ozzy.

I would suggest using the comp.sys.atari.announce group. It is a moderated group so you would have to find out who the moderator is and mail your post to them. I believe the moderator is Yat @ Lexicor (I am not sure of the email address)

Does anyone know where I could get hold of some Degas PI1 and NEOChrome image files? I am working on some image conversion tools and I need some data to test them on, and unfortunately my ST is about 300 miles away so I can't make any of my own :-)

Anything would do, just a bunch of lines or something, as long as the image is recognizable so that I can see if it is being converted properly.

If anyonee has some such files that they could mail me, I would be
extremely grateful.

Is there a way to change the window attributes (closer/full box/info
line/arrows/sliders) *without* closing, deleting and opening a new window?

Specifically, I want to loose the arrows and sliders for "iconifying" a
window (reducing it to the move/title bar only. I now do this by closing
and deleting the window, and then creating and opening another, but this
seems like a "kludgy"(?) way to do it... Does anyone have a better idea?

They're talking about v3.5!! v3.5 of GFA-Basic is an ST/STe version. This
version requires ST-Low, ST-Medium or ST-High.
v3.6, which is the TT version, supports 16 color 640x400 mode on the falcon.

Stefan

|> key click!!! Can you merge in C or 68000 into STOS er???

Yes, you dont have access to GEM, but that doesn't mean that you have to use
STOS's own routines. I have never used the MENU command....

The keyclick can be replaced (with the standard one), and the mouse-pointer
is user defineable, so if it's crap, its the programmers fault, not STOS's.

Yes, and yes respectively for using other languages. load the compiled /
assembled program, and use the instruction CALL (but dont use Malloc etc.).

|> STOS is o.k for kiddies to play with but hey, I wouldn't use it!!!!

Why not? Use 68000 for your speed critical routines, and use STOS for general
admin stuff...

|> STOS Your Inflexable friend.....

I was told that GFA can only include binarys that are < 64k in size....

Why????

|>Yeah! Right, can you use any GEM functions in STOS. Mmmm Don't think so,
|>you have that crap mouse pointer and the menus look dreadful I have yet
|>to see a good stos utility.

That wasn't the point I was arguing: STOS is better for games writing. As for utilities, and the look thereof - it's up to the author of the package to define the look - I _could_ write a utility in STOS that looks EXZCTLY the same as one in GFA Basic - but why would I want to? I hate the look of GEM, and so does everyone I know. Use C.

As for a "good STOS utility", look no further than Kosmic (now in it's third version, I believe) which has scored 80+ in ST Format (I forget the exact figure). Okay, you may not find it too useful, but it's excellent for what it does.

|>All that comes out of STOS is either a sad
|>game or another ART PACKAGE. I hate the file selectors, and as for the
|>key click!!! Can you merge in C or 68000 into STOS er???

a) Write your own file selector if you're picky
b) YES YOU CAN IMPORT MACHINE CODE INTO STOS. I know - I do it all the time.
c) You can turn the key click off - but I agree it is more annoying than
    the standard GEM one.

The thing I like most about STOS (other than the ability to use line numbers if you want to, and that it's easy to get into, unlike GFA) is it's expandability. Want new instructions? Just plug in a new extension file. I don't think you can do that with GFA, but I am prepared to be corrected on this one...

Your yapping about utility programming doesn't make sense. If you want to write a utility, you do it in a portable language like C. If you want to write a game, which generally is not portable because games need to squeeze the machine for performance, then you do so in whatever language you like. STOS gives you easy to use instructions to put graphics to the screen, to move and animate sprites, etc. As far as I know, GFA doesn't.

Each to their own, but I'm sticking with STOS+Assembly for games and C for utilities.

    Ozzy.

What, you mean like C, Pascal, 680x0, STOS etc?

yep.

|> Yeah! Right, can you use any GEM functions in STOS. Mmmm Don't think so,
|> you have that crap mouse pointer and the menus look dreadful I have yet
|> to see a good stos utility. All that comes out of STOS is either a sad
|> game or another ART PACKAGE. I hate the file selectors, and as for the
|> key click!!! Can you merge in C or 68000 into STOS er???

Yeh, STOS cannot use GEM, but you dont have to use STOS stuff either... If
you dont like the STOS keyclick, you can disable it, and re-enable the
standard one. The mouse pointer is user-defineable, and so, if the mouse
pointer is crap its the programmers fault - not STOS's.

Yes, you can include C/68k into STOS. Load it into a bank and use the CALL command (of course, your .PRG must not use GEM / memmory allocation etc.)

|> STOS is o.k for kiddies to play with but hey, I wouldn't use it!!!!

Why not? use it to control the main flow of the program, with other stuff done in 68k for speed...

|> STOS Your Inflexable friend.....

OK, so you cannot use GEM, but you dont have to use the STOS functions either. If you dont like the key click, use the standard on! (click off: poke $42a,8 if I remember correctly...)

The mouse-pointer is user definable, so if its crap, it the programmers fault, not STOS's.

I'm sure a lot of crap programs are written in GFA as well. I dont believe that you can say that all programs written in a given language are crap. The quality of the program is due to the programmer....

Yes, you can merge C or 68k programs into STOS. Simply load them into a bank, and run then using the command CALL. (of course, the program must not use GEM / memmory allocation etc.)

|> STOS is o.k for kiddies to play with but hey, I wouldn't use it!!!!

Fine. The reason for having lots of programming language is that there will be one that suits your needs...

|> STOS Your Inflexable friend.....

I don't really think anyone will mind, but the proper newsgroup to use is
comp.sys.atari.announce (It's a moderated newsgroup).

Generally speaking, adverts only generate bad feeling when they are
(a) off-topic for the newsgroup, and/or (b) posted repeatedly.
An article saying `My wonderful new game, _MutantKongFroggerLhamaAttack_
is now available on atari.archive' is fine.

Good luck with the games, BTW.

Anybody know of any good GFA Basic programming books? I used
Basic a little bit, a long time ago, but GFA Basic seems like a good
language to learn now... Any references would be greatly appreciated.
Please reply by email. Many thanx in advance!

Hello,

In article <D3p90n.I87@exeter.ac.uk>, cs93dlh@dcs.exeter.ac.uk says...

>Yes - just switch the processor to Supervisor mode - then MiNT won't
>pre-empt you until you switch back to User mode.

If I recall right this is not documented and may change in future. The
best way is to go to IPL 7 (though you have to be in supervisor mode to
do that..)

Greetinx,

Ric Klaren

Does anybody know, if there is an emulator for Atari ST running either on a UNIX-
workstation (eg Sun, NeXT, SG)?

Martin (M.Pruefer@tu-bs.de)

Subject: Mag!C v2 - MAGX.H header file errors
Message-ID: <D3uzKr.EIq@cix.compulink.co.uk>
Organization: <none>
X-Newsreader: CixRead/CixComm
Date: Sat, 11 Feb 1995 23:22:03 GMT
Lines: 48

Working my way through the Mag!X v2 manual (English edition) and the
MAGX.H file supplied on disc, I came across the following errors.

1) MAGX.H has some impossible declarations:

```
typedef struct
 {
 char      *in_dos;                /* Adresse der DOS- Semaphore */
 int       *dos_time;              /* Adresse der DOS- Zeit      */
 int       *dos_date;              /* Adresse des DOS- Datums    */
 long      res1;                   /*                            */
 long      res2;                   /*                            */
 long      res3;                   /* ist 0L                     */
 void      *act_pd;                /* Laufendes Programm         */
 long      res4;                   /*                            */
 int       res5;                   /*                            */
 void      res6;                   /*                            */
 void      res7;                   /* interne DOS- Speicherliste */
 void      (*resv_intmem)();       /* DOS- Speicher erweitern    */
 long      (*etv_critic)();        /* etv_critic des GEMDOS      */
 char *    ((*err_to_str)(char e)); /* Umrechnung Code->Klartext  */
 long      res8;                   /*                            */
 long      res9;                   /*                            */
 long      res10;                  /*                            */
 } DOSVARS;
```

What on earth does 'void res6' mean? A variable of type nothing!
erm...

2) The definition:

```
     /* Cookie MagX --> */

     typedef struct
          {
          long    config_status;
          DOSVARS *dosvars;
          AESVARS *aesvars;
          } MAGX_COOKIE;
```

 is _wrong_. The DOSVARS and AESVARS are reversed.

3) The DOSVARS description does not match reality in any way!

Uuuh... The descriptions given in the Mag!X manual work as "advertised" for me. So what's the problem?? However, the DOS and AES vars are redundant. Just use the TOS method and you get the same results. Check your source again.

As far as I can remember a C declaration of "void" is quite legal. I believe it is used as a two byte (or four?) "filler" within a structure. This means the space is filled but not used or assigned to an actual storage location (variable). I also think it is also used as a way of inserting a double pointer. I guess that would mean "don't use this, but use what it is pointing to (and their declarations). Then again, I could be blowing smoke. It's been a while since I used "C".

My baby brother used to use STOS because he thought the ability to
slap a sprite on the screen would make it easier to build a complex
game. Now he doesn't use STOS.....here are his reasons:

- Crap editor.
- Incompatibility problems with more recent machines.
- Lack of structure in the language (Functions & Procedures, etc).
- Debugging sucks.

He's now moved over to using HiSoft Basic instead, as that is a modern
structured basic, which also allows language extensions to be added in
assembly language or C if you want (I coded him a few extensions to get
him started). He's planning to move over to Pascal RSN 'coz the Pure Pascal
source level debugger is a real 'gem' :)

One more thing - my baby brother is 14 years old.

Craig.

Someone posted me a routine for Hardware Scrolling in Truecolor
and I mislaid it. Please could anyone who has a routine please send it to me
or explain what I need to do.

i have set Linewid to 320 because I am displaying a 320 window of a 640 wide
image. If I set only this then it displays correctly. However if I try to
change the video base address in order to scroll 1 of 2 things will happen.

1) Nothing happens.
2) The screen goes haywire.

The above are two different variations of the coding.

Please help me. I know it is probably a simple error.

If your looking to rip out the music file from a say demo, the process is fairly simple. Using MONST or equivelant decrpypt or (and) depack the file. The instructions to initialise the music are...

```
    MOVEQ #1,D0   ;1 is the tune number
    JSR $90000    ;90000 is address of the music (could be any number)
```

if at the address $90000 there are 3 JSR or BSR instructions in a row its a fairly safe bet that this is a music file (if you want conformation search from this point on for the letters TFMX which I believe are embedded in all his music files). Then save the file from the first of the three JSR's.

To play them back in your own program is very simple.

I assume some assembly knowledge,

1) go supervisor mode.

2) call the initialise routine above.

3) during each vbl jsr music+8 (where music is the address of your music).

Programs are available to automate this process but I would recommend doing it the monST way. It helps you learn the machine..

If you want some disks with code, music files etc give me your address and I'll post your some stuff. Or I may even e-mail you it if I can figure out how to..

|>
|> o Crap editor.

Agreed, I suppose. But you _can_ use a text editor to write your code, then import it as ASCII into STOS. Bit too much of a pig, though.

|> o Incompatibility problems with more recent machines.

Unless you're talking about the Falcon, I don't believe you (even then, it's just the mouse that doesn't work). That's not the same as saying that STOS can't use the new advanced features of machines - which is up to the extension writers.

|> o Lack of structure in the language (Functions & Procedures, etc).

Agreed - I want procedures too, however you get around it! Again, this could be an extension (I already have the CONTROL extension which gives me CASE (switch) statements.

|> o Debugging sucks.

Eh? You can't possibly say that about an INTERPRETED language! It tells you exactly what error happened, and exactly which line it happened on. Give me a better debugger than that!

|>He's now moved over to using HiSoft Basic instead, as that is a modern
|>structured basic, which also allows language extensions to be added in

Personally, I'd use C, but then I'm biased 'cos I have to use that in my holiday job. Pascal? Urgh... he'll be using Modula-2 soon, if you don't watch him... but I'm off-topic.

|>One more thing - my baby brother is 14 years old.

Hey - I'm only 19. So your brother used STOS to get into programming and he grew out of it - good for him. I still only use it to link assembly mods together, and 'cos it provides those easy-to-use graphics stuff.

Ozzy.

     Hi,

I've sort of succeeded (not really) at installing X, but I'm not sure what's
wrong. :-(My question is, could somebody who has got it all running please
mail me his mint.cnf, .xinitrc, .twmrc and any other setup I might need. A
brief explanation of how your directory structure is put together would also
be very helpful. advTHANKSance.

I don't program directly. I use the VDI. However several bugs/problems occur with the CrazyDots card only. Could you be so kind as to try my program and see if you see anyway to avoid the problems. All my calls are standard VDI calls, so it was really irritating when it was discovered that the CrazyDots card wouldn't run it properly.

The program is AstroPanic 94! it's on most of the archives now. Make certain you get rev d. so look for p94_revd.zip. The problem occurs when you run it in resolutions higher than 640x400.

Thanks

Dan

I highly doubt it will change, ever, because all interupt handling
routines must run in supervisor mode, and pre-empting an interrupt
handler would be a very silly thing for MiNT to do.

Hi!

I've got a little question regarding resolution independent RSC-File design.
How do I have to built a RSC which can be used in ST-Low, ST-Medium and lots of
other resolutions?

I know that rsrc_obfix() is used. The Compendium writes:
"All objects in '.RSC' Files have their coordinates based on character
positions rather than screen coordinates to allow an object tree to be shown in
any resolution. This function converts those character coordinates to pixel
coordinates based on the current screen resolution."

But using this command doesn't seem to be enough. Any better ideas or tips?

Greetings,
Christian

The DSP assember/debugger that come with the falcon dev docs are pretty good.
The assembler is a straight falcon port of Motorola's own assembler with a post processor to make the .LOD files from the Moto binaries. Very stable & robust.
The GEM based debugger is written by a french company and comes with example code for doing things that are not covered in Atari's docs - like the 56k side of serial data transfers.
I don't know how Hisoft's DevpakDSP compares but I think the falcon dev docs work out slighly cheaper - at least in the UK.

: on this one...

Line numbers went out with the spectrum, how annoying to write some code
and have to use line numbers why do you need them??

: Your yapping about utility programming doesn't make sense. If you want to
: write a utility, you do it in a portable language like C. If you want to
: write a game, which generally is not portable because games need to squeeze
: the machine for performance, then you do so in whatever language you like.
: STOS gives you easy to use instructions to put graphics to the screen, to
: move and animate sprites, etc. As far as I know, GFA doesn't.

: Each to their own, but I'm sticking with STOS+Assembly for games and C
: for utilities.

Stos+Assembly If you could use assembly properly then you would use that
alone and not even touch stos and you would also write your games in it
or even C as these both are much more quicker than stos and you can
'squeeze' the machine as you put it. Optimizing the machines capability
is far more effeciently achieved in assembly or even C then using
prebuilt sprite + graphics routines in stos....

True. But I wouldn't write a utility in STOS anyway.

|>: The thing I like most about STOS (other than the ability to use line numbers
|>: if you want to, and that it's easy to get into, unlike GFA) is it's

|>
|>Line numbers went out with the spectrum, how annoying to write some code
|>and have to use line numbers why do you need them??

Line numbers are very useful from a debugging point of view: at least, I
think so. Okay, it would be nice to turn them off now and then! But to do
that, the whole language would have to be rewritten.

Line numbers also mean that the newbie programmer isn't forced to program
in a highly efficient structured manner from the word go. This (in my

experience) has put a lot of people off programming - all I have to do is look around the lab here at Imperial to the non-computery people trying to do their lab: they hate it. Of course, I am a firm believer in structured code but I think that at the starting stage, programming of any kind is better than no programming at all.

[next paragraph slightly altered from a punctuation point of view]

|>Stos+Assembly. If you could use assembly properly then you would use that
|>alone and not even touch STOS, and you would also write your games in it

|>prebuilt sprite + graphics routines in STOS....

The point is that I _can't_ write code fully in Assembly Language yet - I'm still learning. While I'm doing so, I'd rather call the assembly routines from a language that I know and understand, rather than using C.

I am also learning C slowly at college, I am getting to the state where I could use C rather than STOS. I consider C to be a more "frightening" language than STOS because of it's nasty syntax: in STOS for example you don't have to worry about types etc. Such concepts do noting to improve the beginner's understanding of programming: in fact it is irritating not to be able to divide a floating point number by an integer, since the language forces you to change the integer to a floating point.

When I have learnt a bit more C and a lot more Assembly language, then I will dump STOS. But I don't see why - after all, I am programming for my own enjoyment and not for any sort of profit or recognition. If I were, do you think I would be writing naff platform games in STOS on the ST? No, I'd be writing lightning fast utilities in C on the Iris Indigo, Sun Sparc and Power Macintosh.

I thought the original argument came about from sombody asking for a
flexible language? Your entire argument since then has been about the
easy of use of STOS, and has become more and more contradicting. I think
you are writting naff platform games on the ST because this is all you
can write, or at least at the moment and when you can do somthing better
such as an X-Windows utility Or a Power Mac utility then you probably
will. But it appears to me that you have used STOS for a while and like
it and have never realy tried anything else.....

I need a solution for the notorious readers/writers problem using MiNT.
Psemaphore seems to be the call to use, but the solutions I've found
is based on the possibility to pass a semaphore to another process without
releasing it. Is this possible or should I use something else and not
Psemaphore? Maybe there is a good solution using Psemaphore as it is :-).

All help is appreciated...

Regards, Christer.

I had intended to post this when I lost my interest in GFA about
a year ago. But better late than never :-)

Here are some things that might be useful when programming things
with MiNT. Main things to avoid are PRINT and INPUT command (and
GFA's propiatory MENU & WINDOW commands of course, but who would
use them anyway?).

```

Hallo alle !

Ich suche einen PC-Emulator fuer einen Atari-ST oder STE.
Ich brauch das aber auf einer Disc, da ich diesen Rechner nicht selbst besitze,

ist nur fuer einen guten freund, uns fehlt eben das nullmodemkabel,
ausserdem weiss ich nicht, ob ich auf einem SGI-Rechner das Ataridiscformat
emulieren kann.

entweder mail zu mir oder hier rein oder gleich in mein PSF schicken
ich bedake mich jetzt schon mal dafuer

DJ Illusion

Warwick's GEM++ C++ class library lets you load any number of RSC files,
which is certainly one way around this limit... most RSC editors won't
let you work on a RSC larger than 64k, so it's easier to split them (you

could put all your strings, alerts, icons, etc in one and put your menus
and dialogs and whatnot in the other).

The code could easily be converted to plain ol' C.

>Is there a way around this? (I have allready placed all large bitmap
>icons and a lot of text strings, like alerts, outside the RSC...)

If you use your own RSC handling code (like that from Warwick's GEM++
library), you can use any size you want, or multiple RSC files (which is
probably a better idea, just so your RSC editor doesn't have a fit).

Er... I might be missing something obvious here but how do you do to save
the resource file in the first place? I mean, before you convert the
resource into a source code you'll have to save it as a .RSC-file.

And besides, how do you persuade your RSC-editor into letting you add yet
another object when the RSC-file is about to go past the 64Kb limit? It will
give a stupid error telling us that it cannot add another object because the
file would exceed 64kb.

Well I don't know _where_ to find it, I've never been to Minesota (I haven't
even been to the USA... ;-)), but Devpac 3.1 i probably the best package to
get. It is very fast when it comes to assembling (Compiling) your programs,
and it has a comprehensive macro language and a very good debugger, although
I've seen better debuggers (Not on the Atari range of computers, though).

This is purely a redirection problem and has nothing to do with gcc.
The solution is to include the 'b' flag in the UNIXMODE-env.
This will force the redirections and pipes to do binary transferring instead
of ascii. You don't even have to recompile.

I've had the same problem with the EVERY command. I've come to the point,
that this is an error of the compiler. I've made it with a repeat function
that asks the timer about when and where.

Not very clean and fast, but it worked.

Any stos folks out there know anything about samples and stos?

How bout mods? Is there any routines I could look at to get an idea of
how to use these formats within a program?

Thanks, ALOT!!!!!

I hope tyhat you can understand English, because I have a few problems
with German:

You can buy a hardware board called "PC-Speed" which will change your
Atari into a 286-based PC.

I hope that helps.

Ozzy.

>MEMORY.SYS, but it allocates its own memory, witch is not what I want. I
>(ideally) want to:

NVDI comes with Pure C libraries for using OBM support. I've ported these
to Lattice C & HiSoft Basic, it's very straight-forward.

>1. Open a workstation to my own in-memory mono bitmap
>2. Use this to modify (drawing VDI commands) the bitmap
>3. Change adress/size to fit other bitmaps in memory
>4. Close only at program termination

How I do this in CLAv3 is to open a single OBM workstation. This gives
you a VDI handle to draw with, and the MFDB structure for that OBM as well.

Copy the MFDB so that you have two identical MFDB's (call them source & dest).

Now allocate another block of memory large enough to hold the bitmap, and
set fd_addr in the dest MFDB to point to it.

Now use one of the vr_cpyfm() functions to blit the source bitmap (the one
which is drawn to using the VDI handle) onto the dest bitmap.

This process can be repeated as many times as you like, only using one
workstation handle.

>As an alternative to 3, I could have a workstation open to all bitmaps in
>memory, if possible.

This won't work as there is a severely limited number of OBM handles available
(at least from the EdDI extensions) - around 32 I think.

>I think this is available in some way in eDVI, a system enhancement
>embedded in NVDI, but the NVDI3 documentation is not very helpful...

There is a better doc on the NVDI disc as a text file, with some example
programs (at least there was in NVDI2.5).

Craig.

Hallo alle !

Ich suche einen PC-Emulator fuer einen Atari-ST oder STE.
Ich brauch das aber auf einer Disc, da ich diesen Rechner nicht selbst besitze,
ist nur fuer einen guten freund, uns fehlt eben das nullmodemkabel,
ausserdem weiss ich nicht, ob ich auf einem SGI-Rechner das Ataridiscformat
emulieren kann.

oder eine Programm womit ich 720kByte-PC-dos formatierte Disketten
auf dem Atari ST oder STE lesen kann.

entweder mail zu mir oder hier rein oder gleich in mein PSF schicken
ich bedanke mich jetzt schon mal dafuer.

DJ Illusion

Curious. If the solution is to set UNIXMODE, then clearly this
has something to do with gcc (or its libraries). For no other
C programming systems react to the UNIXMODE variable.

: > : Or do you know of any other commands I could use for this purpose?
: >
: > Well, you could use the TIMER...?

: Yup, I'm using the TIMER to time the elapsed time (so to speak...), but I used
: the EVERY command to *display* the elapsed time on-screen once a second.

Besides malfunctioning, EVERY added about 30k to the size of my compiled
file, so maybe you could try this:

Use TIMER to track elapsed time. When the elapsed time changes, display
it! Make a procedure that compares the last displayed time with the
current time and displays if different, and call this procedure from your
main loop...

Hope this helps.

It depends on the library. This is a feature of the MiNT library,
which is available for GCC, Lattice and PureC.

Dazu brauchst du kein Programm, denn das geht sowieso, das Atari und das DOS
Format ist eigentlich identisch, nur es durfte nicht identisch sein aus
igendwelchen rechtlichen Gruenden.

Also hat Atari an die Stelle, an der DOS die Version des Betriebssystems
ablegt, einfach quatsch gesetzt, da diese Frage am Atari ignoriert wird.

In Klartext, auf DOS formatierte Disks lassen sich auf den Atari
weiterverarbeiten,
auf Atari formatierte aber nicht auf der DOS Kiste.

Urspruenglich hatten wir uns mal ein kleines Assembler Prg geschrieben, um
Atari disks auch noch nachtraeglich umzusetzen, spaeter, jedenfalls glaube
ich, wenn wir mit FCopy 3.0 formatiert haben, war das bereits 100%iges
DOSformat.

Es gab da mal eine Softwareversion vor langer langer Zeit, habe aber nur
schlechte Erinnerungen daran, der SoftwareAladin (MacEmulator) war da viel
stabiler

Yes, that IS a problem :-/ I'm currently using K-RES (prone to

chrashing...), but I'm looking for a new RSC-editor. New RSC-editors SHOULD support files >64k, because the new RSC-format sopports this. The problem is with ~RSRC_LOAD()

BTW, does anybody know if ORCS (Ottos Resource Construction Set) is still supported? From what I've heard this (& Interface) is one of the best...

I can inform evryone that I have solved my problem whith Floats in CC65. It tooked me 2 weeks to understand that the example in the FP65-manual was corrupt. The example looks like this...

```
#include "stdio.h"
#include "math.h"

main (argc, argv)
int argc;
char *argv[];
{
  char buf[20];
  char f1[6], f2[6];

  atof(f1, argv[1]);
  atof(f2, argv[2]);
```

```
          fadd(f1, f1, f2);

          printf("%s + %s = ", argv[1], argv[2]);
          fputs(ftoa(buf, f1), stdout);
          fputc('\n', stdout);
        }
```

And the second last Line is the one who have gived me this 2 weeks of trouble.

The correct line is...

```
          fputs(ftoa(f1, buf), stdout);
```

Can someone open the FP65 package and edit this manual. I cannot as I take This Newsgroup throw Fiodonet. I sugest ex Michael Current to do this so not evryone goes ion this doc and makes changes. CB-)
Can you confirm this suggestion Mike.?? (Y/n)

I dont want enyone else to get the same problem I had as it unnescisary.
But I have learned a lot of it I can tell you all as I have tried many combinations here to make an own simpler program who I wanted to print out 1.0 to the screen as String to float back to string again. The XE only wanted to print 1.0 as 0.100043E-<6 and I understand that if this program wanted to put the buf into the float instead of put the float into the buf.

I was very happy 5 am this morning when I notised this error in the only list example there is for CC65 at all. One list, one error.
(I have also baught Prospero C and Lattice C in second hand for my ST and Prospero is GREAT. I havent looked at Lattice yet as I picked it up today. But I will program my dear 130XE in first place.)

Actually this probably has something to do with the shell that is used.
As I recall the UNIXMODE has to do with the libraries. If so, the shell
has to be recompiled to make it work without the environment needed.

I had similar problems when I first ported MGIF to gcc, but all was fine
after I did as follows:

```
   if ((stream = fopen(fname, "wb")) == NULL)
      return(0);

   /*
    * This is the important part.
    */

#ifdef __GNUC__
   stream->_flag |= _IOBIN;   /* The GNU libraries don't like "wb" */
#endif
```

I believe that changing 'stream' above to 'stdout' will solve your problem.
There is probably a nicer way to do the same, but this works fine.

:). That's why I'm looking for sources, not libraries. I can
always modify sources for my needs. But there seems to be
many libraries that offer this capability so it's not a
problem any more.

I think ORCS is nowadays commercial product. A while ago I visited
one German ftp which had a text saying this. Don't know more about
it...

Bist Du Dir da sicher? Ich hatte bisher noch keine Probleme,, Atari-
formatierte Disks mit dem PC einzulesen, weder unter Dos noch unter Linux.
Die Disketten hab ich ganz normal vom Atari-Desktop aus formatiert.

: >make the program limited to the newest TOS versions, and so is
: >unacceptable to me...

: Warwick's GEM++ C++ class library lets you load any number of RSC files,
: which is certainly one way around this limit... most RSC editors won't
: let you work on a RSC larger than 64k, so it's easier to split them (you
: could put all your strings, alerts, icons, etc in one and put your menus
: and dialogs and whatnot in the other).

Thank you, this sounds like a very flexible and good solution to my problem,
but... (see below)

: The code could easily be converted to plain ol' C.

The problem is, I'm not using C, I'm using GFA basic... I guess I could
write my own routines (or convert the Warwick ones to GFA... OR, if
anybody have done this, they could send it to me? :-)

Hi,

Is there a system call in MiNT/MultiTOS to (temporary) disable multitasking? It would come in handy if you needed real-time applications, and a lot of games could use it. Even if it's not exactly pushing clean programming, I would like such a quirk better than having to reboot my Falcon without MultiTOS everytime I want to run such a program.

Idea?

Regards,

Es gibt keine PD-Software zur PC-Emulation. Solltest Du doch was
finden, lass die SGI eine DOS-Diskette schreiben. Ataris
lesen sowas einfach so.

Rex Wilhm asked about a cheap assembler:

Hunt around the anon. ftp sites & you'll find a package called
Sozobon C. This is a 'C' compiler for the Atari and includes a fair
68000 assembler.

Note that code which you write, and library subroutines will use
'C' argument passing - values are pushed on the stack (a top - down
LIFO). If you get confused, you can always compile 'C' functions to
assembly and see how IT does this.

Doing it this way, you can always use 'C' for the difficult things.

Assembly statements can be placed in-line as follows:

```
retnd_value=asm("
     move.b   #A_BYTE, D1   ;comment
```

```
 LABEL1:move.w    #A_WORD, D2   ;
         .
         .
         ");
```

Automatic (local) varaibles are not specifically referenced in the compilers output - only their position on the stack. Global variables and functions have an underscore character prefixed.

'Fraid you can't get Public Domain Hardware though.

```
   __           | _|
  /  \_         |
 |         _ \  |  |    _ \
\ \    /  <   | |  |   /  |
 \____/  \___/ _| _| _|   |
```

Ich hab mir sagen lassen, dass (wenn Du unter Dos arbeitest) es von der Dos-
Version abhaengt, ob Du ST-Disks laden kannst. Bei alten Dos-Versionen wird
immer die uebliche Kennung auf dem Boot-Sektor (ich weiss leider nicht mehr,
welche Zeichenfolge das war ... MSDOS ?) verlangt. Neuere Versionen koennen
soviel ich weiss sogar Disketten einlesen, die mehr als 80 Spuren enthalten...
(also nicht mehr dem ueblichen Dos-Format entsprechen).

Falls ich mich taeusche, dann korrigiert mich bitte.

Hi !

I`m running the wordprocessor That's Write on my old

520 STM. I have too little free mem when running this prog with
more than one font, so i wonder if there is possible to
release the memory which the Desk Acc. Buffer uses ?
If so, how can it be done.

I've heard that this buffer is almost 50k. Is that right ?

Is one supposed to lock the screen and hide the mouse before calling
graf_shrinkbox() and similar functions? I suspect not but I can't find anything
about it in the developer docs.

I have to confess I'm fed up to the back teeth with the inflexible nature of STOS - even though I have a hundred extensions for it its the actual format of the code that bothers me. So I recently saw a firm selling off GFA Basic quite cheap and was tempted to buy - except, does it work on the Falcon? I know that a few people are using GFA on the Falcon but are there fixes I need first (like with STOS)? and are these on FTP sites?

Thanks anyway,

RiCH

Hi...I am not sure if this has been discussed here...and if it has I am sorry.

I used to have a Atari St and I do not anymore, but my cousin does and he wants to get software for his Atari ST so he can get a PPP pr SLIP account on the Internet. I have a MAC and we have a WEB Browser, Fetch - For FTP Sites, Eudora - Mail Reader...etc...
There must be somethong out there for Atari? A Internet Package? Something he can use besides a basic Shell Account??

Please help..I obviously do not get to read this group often so could you please send details to my internet address below?

Thanks for any help in advance!!

STOS is more inflexable than GFA Basic? Give me a break... (yes I have used
GFA & STOS, the latter wins every time).

What is this? I think we should rename this group alt.lovers.gfa.basic

Anyone use any other language out here?

    Ozzy.

I have version 1.2 of a56, the 56001 assembler for the Falcon, but it always
crashes with a bus-error. This happens either with or without MiNT loaded, and
from any desktop or Cli I tried. Q: Is there a _working_ assembler around
somewhere? Please help: now that I finally came across a reasonable book on
Motorola DSP programming, I still can't make my own digital effects because
the assembler is brain-dead.

|> how to use these formats within a program?
|>

The STOS Maestro extension enables samples to be played. The Missing Link (or was it Misty) extension can also play samples, and is shareware....

As for .MODs, the STOS tracker extension allows them to be played (after being converted to it's own ABK format.

I believe there is a tracker extension for the Falcon (Rich?), not to mention the extension that I am writting. This will be Falcon only, so wont be much use if you have an ST....

OK?

Anthony

Anyone have any experience programming on the Crazy Dots video Card? Anywhere I can find any specs? They seem to have some limit on the VDI drawing primitives, but I don't personally have one so testing for me is limited. Any help would be very appreciated.

Thanks

Dan Ackerman

I've posted this originally in comp.sys.artari.st, then in comp.sys.atari.st.tech, and now here. Hopefully someone can answer my questions - I'm sure others have had similar problems :--)

Bonjour!I have an
Atari SLM804 laser printer, hooked up (of course!) through my DMA port. Now, the problem I am having is that when I go to print from something like NeoDesk or Edith Pro I can't! simple, eh?! Is there anything out there in terms of programs, fixes, etc that would allow me to redirect output from the parallel to DMA? This problem happens whether or not SpeedoGDOS is loaded, which surprises me as I would have thought GDOS would have redirected output itself. But I guess prg like EdithPro and NeoDesk ignore GDOS. Any help would be appreciated.thanks/merci-ken

I think they've ported a tcp/ip suite, if not it should not be too difficult to do so; whether any drivers exist for that I don't know.

I am learning scheme and would like to have some sort of compiler (I already have the scm interpreter, but with that I cannot create standalone executables, and it does not support MiNT signals).

is there a scheme compiler for the ST, and where can I find it?

Erlend.

You cannot directly connect a Pocket Lan Adapter to the Atari centronix
port due to lacking signals (Acknowledge, Selectin, Selectout, ...).

But there exists hardware to connect a Dlink DE600 to the catridge port.
Hardware layout is available from fortec.tuwien.ac.at.

In fact I'm currently testing a self written .xif driver for this combo.
I works quiet well and the next MintNet release will contain that driver.
(ftp throughput is as good as can be expected for the DE600, ie 90k/sec
at up *and* download).

I am experimenting with serial comms between my ST's (Falcon, Mega, and STFM).
Is there a clean way of getting the Serial port interrupt addresses for the
Falcon? STxx are OK because I can use Mfpint(). But on the Falcon the SCC is
used for Serial Comms (``ST-compatible serial port'') -- and there does not
seem to be any way of setting/restoring these vectors! Any ideas?

    You are probably best leaving it set to -1. Of course with
    this you will not be able to launch any other programs
    whilst gcc is running but their is not much you can do
    about that. GCC does require oodles of ram G++ is a real
    hog, and I set stksize to -6Mb on the falcon. On 2.5Mb
    the c++ compiler is very limited you wont be able to
    even #include <String.h>, well thats not quite true
    but you will need to edit the file by removing all
    the inline stuff and changing

        #include <iostream.h>

    to
        class istream;
        class ostream;

There are a few other changes but I can't remember them.
These problems were a major factor when I decided to go
get a falcon so I could have enough ram for g++.

By the way while porting 261 I tried setting stksize to
102400, (note positive value here) and I don't recall
too many problems, though I was a little concerned
about memory fragmentation, especially as I tend to
launch other stuff whilst compiling.

Hi all,

I remember hearing something a while ago about a Revision Control
System for different revisions of software.

Can anyone give me any details about this, such as how useful it
actually is, and where I can get hold of it (The term GNU was
mentioned - so it must be free :-)) , I have looked in the GNU
section in a.a.u.e but cannot find it.

Any views would be appreciated.

Beric..

That is known to the developers. There's also a bug in the linker.
It doesn't effect compiled programs but can sometimes chrash your machine.
Libc[i].a functions getting input from keyboard process newlines wrong
with MiNT.

New versions of binaries and libs will be available when the
developers have time for it (hey, remember that this is a freeware
project! :-).

I wondered about this, having read your PLIP file ...

> But there exists hardware to connect a Dlink DE600 to the catridge
> port. Hardware layout is available from fortec.tuwien.ac.at.

... however I *had* heard that other TCP/IP drivers for the Atari did use
the DE600. Didn't know about the cartridge port bit.

Now thats *exactly* what I hoped you would say! Any chance of it working
on a TT?

Thanks

Roland.

I would recommend using RCS which is popular on many UNIX systems.
You can get it at a.a.u.e in the 'Programming' directory (I think).
Version 5.6 is available there, complete with source code in the file
'rcs56.zoo'. There are also another few versions at a.a.u.e, you can
find these by doing a grep for 'rcs' on the index.

I started using RCS some time ago as I was required to for a
programming project I was working on. Since then I have been a
complete convert. I now find myself using it to backup almost every
text based file I create, including WP documents, POSTSCRIPT files,
shell scripts etc.

Its pretty easy to get started with it as you only need to know a few
commands to begin backing things up. Once up and running there is a
whole host of additional commands you can use to configure it to your
preferences.

I hope this is of some help.

Nick.

STOS FAQ v0.8

Generated by: STOS Mailing List - stos@bath.ac.uk

Enquiries: Should be sent to Les Greenhalgh - Email address in Authors section.

Authors: mbitdc9235@newi.ac.uk - a.k.a MUG U.K(tm)/Mike Mee
c9251129@zeus.hu.ac.uk - a.k.a ()rm of Digitallis/Jon Lewis
Mark.Montreuil_DGNM@banyan.dgim.doc.ca - a.k.a Mark Montreuil !
ma2lgj@midge.bath.ack.uk - a.k.a Les Greenhalgh
ae@minster.york.ac.uk - a.k.a Andrei Ellman

This FAQ will hopefully answer all the questions you have on the programming language, STOS. If you wish to add any new sections to this FAQ, please send an example outline to the above Email address.

Abbreviations used.

STU - ST User (more commonly known as ST User)
STF - ST Format (more commonly known as ST Doormat)
STR - ST Review

BTW - By the way
sp? - Spelling confirmation required ! We maybe coders, but there is no guarantee wee kan spel !

[ ] - Comments from a mailing list member - usually Andrei !

1. What is STOS ?

Written by Francois Lionet and Constantin Sotiroupolous (Spelling please?)

Published by Mandarin/Europress Software

STOS is the forerunner to the Amiga version, AMOS, AMOS Pro etc..
And its a great shame that STOS hasn't been supported by Mandarin since they released AMOS Pro because there are a lot of people who use their language and get frustrated because they can't call for help!

Mark Montreuil came up with this definition .....

STOS (for ST Operating System) is a programming language based on BASIC (Beginner's All-purpose Symbolic Instruction Code), that makes creating sound, graphics and movement on the Atari 16/32 bit line of computers as painless as possible. STOS has commands that handle input/output, animation, music, logic and program execution in an easy to understand way. A STOS programmer can spend more time on actual game design than on the "fiddly bits".

Many things that were not considered possible, such as changing screen resolutions in the middle of a program or writing Arcade-type games in a BASIC language, are a reality with STOS. Hundreds of quality games, demoes, utilities and educational packages have already been written in STOS.

STOS is a full-featured software development tool. Using STOS, art screens created in specialized paint packages, like Degas, Neo or Crack Art, can be easily used to create basic game graphics. STOS has built-in Sprite, Music, Map, Font and Sound effects generators. You can write some code, and, at a keypress, call up any of the added utilities (called accessories) to work on added features. You can even write your own accesssories, to use at any time.

Machine-code routines can be called from within STOS, and new commands (called extensions), can be written to enhance STOS's functionality. Some extensions that are currently available include 3D, the Missing Link and Misty (see Extensions for further information).

All in all, STOS is the perfect tool to bring your game ideas to reality without having to trudge through reams of machine code!

Cheers Mark for the few above lines on STOS. Anyone else fancy adding more to it ??

---

2. Where do I get hold of it ?

Has been given away with magazine cover disks, ST Format and ST User (I need a list of which ones!). The problem with the versions given away with the magazines is that they were no manuals, however ST Doormat, oops, ST Format will sell you the complete STOS kit. That includes the following:

STOS, STOS Compiler, STOS Maestro (with sampler?)

for around the 60 quid mark. Not sure about this at the moment, until I dig out one of my magazines and have a read.

Also most mail-order firms should stock a copy of STOS. Try to haggle and get some decent prices. Don't buy the Interpreter without buying the Compiler !

Apparently every ST sold in Britain comes free with a copy of STOS with the manual thrown in. Any more information on *exactly* you get would be appreciated. If you have the spare money and you want an extra development machine, then it maybe worth getting hold of one ?

()rm has suggested that you look at bargain buckets in computer shops or check out the odd car-boot sale. But that is ()rms sense of humour !!

---

3. What is it like to program ?

()rm says .....

STOS is BASIC, but a powerful version of BASIC. It has built in sprite handling routines, music commands, sound effects and numerous other routines, functions and commands which can be very useful.

At first glance STOS looks horrible, but after a few weeks of programming it, you will wonder how you ever lived life without it (OK, not the truth, but it IS good for something!)

As STOS is based on BASIC, it is very easy to program, in fact, I'd go so far as saying STOS is the easiest BASIC to write anything in. Everything can be set up very easily, for example, you want to play a sample yeah? Get the sample player extension, whack it in the STOS folder and then re-boot.

(Or for those lucky hard-drive owners, unlike ()rm, copy all the extensions into your STOS folder and leave them there !!)

Now play your sample with the command SAMPLAY.. No need to load routines into a memory bank, peek and poke a few numbers and call it. This is one of the nice things about STOS, its upgradeability..

Pity that the language hasn't been given a major rehaul with all these new functions BUILT IN.

Andrei has this to say on the matter ....

When STOS was designed, it was made to make writing games easy. The programmer would think mostly on the WHAT, rather than the HOW. In other words, it was supposed to make you able tp program games without having to think about how tyour ST works. For example, sprites could easily be displayed, moved, and animated with ease. Unfortunately STOS sprites tended to be a bit slow, but The Missing Link extension replaces STOS sprites with Bobs. Bobs are a bit more tricky to implement (you have to move and animate and erase them yourself), but they are much faster than STOS sprites. There is a similar story for other aspects of the language.

STOS is a BASIC that uses line-numbers. This tends to be messy and often encourages programmers to write "Sphaghetti code" (There are gotos running all over the place). It would have been better if STOS had no line numbers, but would call procedures by their names, and have one command per line which was indented appropriately.

---

4. What extras are available to compliment it ?

STOS Compiler - Actually makes your programs faster (HAHAH!)

STOS Maestro - Sample playback routines for STOS (and sampling hardware depending on which version you buy).

STOS 3D - Add 3D commands to your games. Only drawback is that all the objects have to be loaded from disk each time they are required.

STOS Tracker - Playback tracker tunes, albiet a bit slowley..

Andrei has added this as well .....

I have heard about a program written in STOS which adds proper procedures to STOS and gets rid of line numbers. I believe that this compiles the new type of code into STOS. This was originally listed in a STOS club newsletter, and Goomans have a copy on disk. Does anyone have experience using it?

---

5. Can I *really* write commercial quality games with it ?

Commercial Games

Check out:

Bullet Train (revamped version was released in France a few years ago)
Bumpy
Cartoon Capers (also came with a dual-joystick extension)
Cool Croc Twins
Gilberts Day Out
Prehistorik
Skate Tribe
(We think there's a few more..)

Educational programs

All Fun School programs (also have full STOS source on disk)

Henrietta Series by Lander (also with full STOS source on disk)

Loads of other educational programs by other firms. Some names would be appreciated.

Commercial quality shareware/public domain games

There are also a few examples of top quality shareware games written with STOS. So grab a hold of your favourite PD library and ask for the following:

Grandad & The Quest For The Holey Vest by Ian Scott.
The Glass Buttock of Tharg by Ian Scott.
Grandad II - The Search for Sandwiches by Ian Scott.

Ozone by Nick xxxx (can't remember his surname!) - was turned down by Ocean at the last minute because they found out it was written in STOS.

Pyscho Pig, Sim Pig, Colour Clash, Fatemaster by AnimalSoft.

Plop by ()rm - apparently the freebie you get when you register is better!

Bio Hazard by Les Greenhalgh (full review coming soon!)

Most of the stuff by Andrei (some feature STE 8 player options) of which he himself recommends the following: Linecrash, Mazewar ST, Video Games v0.5 Pacmen, Alienation (currently undergoing a re-write) ?

[Hopefully, after my HND is over and I manage to get hold of a modem, I will do proper reviews of ALL the STOS stuff I have got. The definitive review will be posted in parts as soon as I have the time ! - MUG U.K]

---

6. Are there any books available ?

As far as I know there is the one by Stephen Hill, which was published by Sigma Press. Its title is Games Makers Manual. It teaches you a seperate game style within a chapter, and for the more advanced, gives you the lowdown on writing extensions. Does anyone know if Sigma released an accompanying disk with all the routines typed out ? If not, anyone fancy knocking up a disk since the book has not exactly been supported by Sigma ?

There is a STOS guide published by a PD library, but whether its any good is another matter all together. It is 30 quid and contains some 400 pages of STOS related stuff. Takes you from the complete beginning and shows you how to write arcade, strategy and educational programs. Anyone out there know how good it is ?

Disk Magazines/Newsletters

Not exactly books, but disk magazines are in abundance. Some contain partial STOS sections, whilst there are (or in some cases, were) others which are STOS related and nothing else is mentioned.

Check out:

STOS Bits 1 (now dead - forerunner to HP Source)

HP Source 1,2 (now dead)

STOSSER Disk Magazine (still going - now on issue 11 ?)

ST Programmer (I've only seen one issue!)

Ledgers (had an occasional STOS section)

Maggie (in amongst the swear words was the occasional STOS column)

Anyone know of any other magazines ? Please send in details of whether the magazine is going or not.

Also required is a compilation of what was printed in ST Abuser, ST Doormat and ST Review regards STOS, along with a similar listing of useful routines and articles from STOS Newsletter. Unless, there is already one available.

According to Andrei, New Atari User (still alive?) had a STOS column in the 16-bit suppliment ? Also there is the Atari Magazine, a French mag which also has a STOS column or mentions it occasionally !

There is an online-help program for use with The Missing Link. This handy reference guide will give you the keyword and appropriate parameters for each Missing Link command. Just like Windows Help files on a PC !!

---

7. What are extensions, and where do I get them from ?

Extensions are a way of further expanding STOS. All the following are extensions, Compiler, Maestro, 3D and Tracker (Released in the P.D.)

There are numerous extensions in the public domain. The favourites being MISTY and MISSING LINK, both been written by a group called Top Notch. They add commands which SHOULD have been in STOS from the start.

Les Green (ma2lgj@midge.bath.ac.uk) is in the middle of adding some superb sprite routines to his own extension. It also allows STE hardware screens to be used etc. More details when it is released.

Andrei has sent me the following exhaustive list of extensions available for STOS. It was in two parts, one by Andrei and the other by Les Greenhalgh. I will use Les' version as it lists the FTP sites where most of them can be found. Take it away Les .....

The consise guide to Stos extensions.
By L.J.Greenhalgh

Terminology

a.a = atari archive umich edu in either language or progamming folders
s.w = Shareware
cr = Shareware version is crippled
pd = Public Domain and freely available
GI = Goodman International PD Library
STF = was on an ST Format cover disc

Misty extension by Top Notch Software (sw STF)
Can be found: a.a in both Stosers.zip and Misty.lzh files
Miscellaneous graphics commands including an improved screencopy which can use any of the STs bitplanes, instead of 4 at a time in STOS.
Excellent stuff.

Missing Link extension Top notch Software (sw cr STF)
Can be found: a.a in Link1.lzh - Link3.lzh
about 50 new gfx commands including replacement sprite commands and commands for dealing with maps and multiple palettes on screen.
A must have.

Extra extension by Martin Cubbit (pd)
Can be found: a.a extra.zip
loads of miscellaneous commands including cookie reading commands, mirror and blur sections of screen , paste strings in opaque mode, format text, detect tos version etc.
Brilliant

Stars extension by Lee Upcroft (pd STF)
Can be found: a.a stossers.zip
Commands for drawing 3D and 2D starfields, very quick.
Excellent.

Blitter extension by Asa Burrows (sw STF)
Can be found: a.a in their uploads folder in blitter.zip
Commands for using the blitter in MegaSTEs, MEGASTs, STEs, Falcons?
Seems a bit slow.

MIDI extension by Asa Burrows (pd STF)
Can be found STF , GI
Commands for using the STs MIDI port.
Never used it.

Stos Vidi extension (c)
Commands for interfacing with the Rombo VIDI digitiser.
Never used it.

Stos Maestro (c)
Commands for playing samples through Stos, excellent although better performance can be obtained from the Missing Link's Digiplay command.
[AE - I think that TML does not emulate STOS Maestro's reverse playing abilities]

Stos Pac/Squasher ? (c)
Commands for packing/unpacking all types of memory bank not just pictures. Never used it. Depacking ability surpassed by Missing Link. TML supports packers that can pack tighter than STOS Squasher (eg. Pack Ice). Unbelievably buggy - read docs with Mega Depacker for more information.

STOS Sticks (c) [AE 26-4] Is that Twinstix?
Commands for reading both joy stick ports. Unnecessary, use TML equivalent.

Control Extension by Les Greenhalgh (pd)
Can be found: a.a in uploads directory in blitter.zip
Includes commands for reading a parallel port joystick adaptor, a switch construct for STOS, a super fast add command and other miscellaneous stuff.

Quick Extension by ? (sw?)
Can be found: Stossers disczine
Commands for super fast horizontal scrolling, rasters, stars.
Seems good.

STOS TOME by Aaron Fothergill (c)
Can be found: GI
Commands for drawing maps, irrelevent now the Missing Link exists.

STOS 3D by Voodoo Software (c)
Commands for manipulating 3D objects, unusable unless you have a hard-drive and 1 meg. Too limited, no commands for rotating around current heading and no commands for representing horizons, ground, etc. Very large files. Objects cannot be stored in banks, but have to be loaded with purpose made extension commands.

Other forms of extensions that you know about would be appreciated in this list. As ()rm recently suggested, all those who are in the process of writing an extension, put your heads together and come up with one mother of an extension !!

There are other ways of improving STOS without having to use extensions. These take the form of machine code routines which you pass some variables and call them. A few of them have been taken from the same list as compiled by Les and Andrei.

Some Machine language routines used with STOS

BITCOPY
This is what I believe to be a routine that is similar to Misty's SKOPY command. Top Notch used this in their demos before they wrote MISTY which now makes BITCOPY obsolete.

BORDER
Top and Bottom border overscan in STOS. STOS runs just as normal, except when you use the mouse/joystick/keyboard, the overscan dies. The top of the screen starts as 'physic', and continues as normal as if the screen was greater than 32K in size. Works on STFMs and STEs.
Found on a disk of the Cunning Demo.

OVERSTOS
Full screen overscan. Can only display a static picture. I think this has problems on STEs. Found on a disk of the Cunning Demo.

RASTER By Neil STewart of Flair
Routine that changes the value of only one colour on the screen. This was later implemented in Son of TML's RASTER command. Can be found on one of the disks from the Cunning Demos by ACO & Flair.

STOS-SPEAK by ?
A patched version of the original SPEAK.PRG - allows you to use speech inside your programs by sending a string of characters to the program.

SPECTRUM (I am not sure of the exact name)
Displays spectrum 512 colour pictures. Very limited as you can only exit from display by pressing space. Shareware (was once on a STF coverdisk. If you register for 15 pounds (A rip-off), you get a version that can display the pictures in a window. I have not got the registered version. This was advertised in ST Format in 1992)

STOS_512 By ?
Routine that splits the screen into several palettes of 512 colours.
This was later implememnted in TML's PALSPLIT command.

TRACKER
An improved mod player. Found on a disk of the Cunning Demo. ()rm is hopefully going to working on an interface to allow the use of the Ninja Replayer routine from within STOS. More news when he has finished failing his degree !

If anyone fancies adding to the above list, then please do. You know where to send any additional information. Apparently larger lists exist of extensions for STOS, but these can be found in STOSSER magazine. If someone can upload or Email a copy of the latest list, I can add them to the above list.

---

8. Recommended programs - commercial & shareware

A *DECENT* art package. Recommended commerical ones are:

Crackart (recommended by ()rm)
Dpaint ST (recommended by: MUG U.K(tm))
NeoChrome Master v2.28 (recommended by: MUG U.K(tm))

A *DECENT* tracker editor. Try not to rip off someone elses work !

Sample-based ones .....

ProTracker 2 by Wizzcat/Deltaforce
Octalyser by ?? (STE only, but has option for 8 channels of music)

Soundchip-based ones

Megatizer by Sector One.
SID Editor by Animal Mine (improved version of Tri-Sound, with SID Emulation)
XLR8 Editor by Sentry

(all the above have the ability to assign 1 channel to play samples)

Without plugging my own stuff too much, if you can find copies of my 'Makin Sweet Music Disks Vols 1-3', they all contained ripped music from games and demos. Each folder on the disk contained the 68000, GFA and STOS replay routines ! If I can get a tune playing in 68000 or GFA, then I don't see why I can't knock up a STOS front-end.

()rms music player program has all the necessary information on screen for setting up and calling the myriads of music available in the ST music-scene.

A STOS Patch program (enables your compiled code to work on ST, TT & Mega STE and even the Falcon !!!)

Currently it is STOS FIX v3.0 by ?? and it is only available from Goodman Enterprises ! Charging for a program which fixes your STOS code

and leaves a bloody advert for Goodman on the front of your code ....
Monopolistic practicies anyone ? Anyone fancy making a new version without the large Goodmans advert ? Or is that enticing piracy ??

---

9. Miscellaneous Section

"What versions of STOS have come out?"
"What is the History of STOS?"

Both questions answered by Andrei.

STOS 1 was only released in France in early 1988 (published by Jawx).

STOS 2.3 Was released in the UK By Mandarin in November/October 1988

STOS 2.4 Is a patch to remove some bugs in STOS 2.3 and make it work with the compiler (1989)

STOS 2.5 Is a patch to make STOS run on the STE (1989)

STOS 2.6 is a patch to make STOS run on STEs with TOS 1.62 (1990)
If your version of STOS is below 2.6, You must update it immediately, especially the compiler. You will then be able to make programs that run on TOS 1.62

STOS 2.7 (compiler only). Makes programs that use the STOS tracker extension compile. I am not sure whether or not it is nescesary or not if you are not using the tracker extension.

I once remember hearing in 1990 that Francois Lionet was writing a version of STOS called STOS PRO (or STOS PLUS). For some reason, this was abandoned. Francois did have to leave programming to do his military service. I am not sure if he is back yet (not as far as I know as AMOS Pro is waiting to be upgraded to AGA chipset - MUG U.K)

Also, FALCOS was being developed (STOS for the Falcon). Apparently, this project was stopped due to a disagreement between Atari and the developers.

"How to make it not look like STOS!" - Andrei answers a few more questions.

- Try and avoid the 'appear' command (unless the appear you are using is fast).

This tends to give the game away. STOS 'appear' does not let you press a key to speed things up.

- Get rid of the F-key window first.

There is nothing more "Written in STOS" than seeing the F-Key window when you have just loaded a game. Alter this within the compiler settings.

- Change the font.

The Lo-Rez font also gives it away. I personally use the font of the Atari 8-Bit computers.

- Change the mouse pointer - almost as ugly as the AMOS Professional one !

- Different type of cursor - everyone recognises that thick ugly cursor !

- Avoid using the SHOOT and BOOM and BELL commands unless nescesary. Replace them with sound effects from a piece of hacked music ! Try the following:

  Count Zero   - Killing Game Show (20 SFX)
  Mad Max   - Numerous pieces have Sound FX embedded
  David Whittaker - His fast music may be awful, but most have SFX

- Replace the STOS keyboard click or get rid of it completely. There is a poke to use the standard ST keyboard click from STOS, but I don't remember it. [Details would be nice !!]

- Different windows and File selectors (not sure about the new Windows extension).

You may want to mention that it was written in STOS directly on the title screen, or say this in the documentation. The idea is that as well as letting people know it was written in STOS, it can give the WOW effect if it is good.

Shrinking the size of your compiled code by MUG U.K

Well, this section is fairly easy to do. Follow these simple rules.

If you have ANY other packer not listed here, BIN IT! It is either incompatible with the Falcon, or has a pack ratio similar to that of the original versions of the Jek Packer - ie. rubbish !

Packers - The Definitive List

Speed Packer v3.0 - definitely the best. AUTO Depack program as well

as Self-extracting archives !

Atomic v3.5/v3.6 - second best. Apparently does not work on the Falcon but I will release some source code that might allow you to make your own program headers for data file packed versions of Atomik files.

ICE v2.40 - Stalwart and much used packer. Still used after all these years. Compatible with the Falcon but it cannot match the above two for output size.

Anyone recommend any others ?

Depacker Programs

I can heartily recommend the following programs for converting your old packer formats back into STOS code so you can patch them and repack them to work on newer machines. Try....

Multi Depack v1.5 (or the leaked preview versions of 2.0/3.0) - I wrote this!
Mega Depacker v2.12 (by Mike Watson)
Naughty Depacker
New Depack (new name for Mega Depacker)

If the program will not depack with any of the above, then there must be a reason why it won't let you unpack it !!

Well this is the end of the STOS FAQ, designed and written by members of the STOS Mailing List (stos@bath.ac.uk).

Anyone is welcome and indeed, encouraged to send in alterations and additions to this FAQ.

We hope you found it useful. Any Public Domain library is allowed to distribute this FAQ, but please do not distribute any versions lower than v1.0 as they are pre-release and probably quite embarrassingly small in size. Also do not forget to credit that this FAQ was generated by members of the STOS Mailing List.

Whar I'd need to know is: What about compatibility between different parallel-port connectors ? (hardware and software)

Do I have to buy this special connector to use the interface and software from the TU Wien or can I use any other connector as well ?

My most favorite software (besides the basic driver) would be a 'harddisk' driver that can mount NFS-volumes as if they were plain AHDI drives and a simple telnet client.

A great thing to have would be a SCSI-network connector that can disguise as a plain SCSI harddisk to the machine it is connected to. This would be dead simple to use from the ST or any other SCSI-capable machine without the need for special network driver software...

Greetings,
Ripley

Well in my experience different adaptors need different drivers. The DE600 and DE620 won't work with each others drivers for instance. DLINK and XIRCOM need their own drivers as do LONGSHINE. AFAICS you need a *real* DE600 to get this to work. OTOH DE600 are obsolete - so you should be able to pick one up quite cheaply. They might even be available new still.

> Do I have to buy this special connector to use the interface and
> software from the TU Wien or can I use any other connector as well

I FTPed some of the stuff on the DE-600/Cartridge adaptor board yesterday. The .IMG circuit diagram make sense - but the PCB seems to be in HP plotter language (at least thats my guess). Does anybody make/sell a PCB for this adaptor - or alternatively have the PCB in a bitmap file I could make my own template from?

> My most favorite software (besides the basic driver) would be a
> 'harddisk' driver that can mount NFS-volumes as if they were plain

Surely MiNT-Net can already do this? At least I can mount TT volumes on my Linux PC. I haven't tried telnet myself.

> A great thing to have would be a SCSI-network connector that can
> disguise as a plain SCSI harddisk to the machine it is connected to.
> This would be dead simple to use from the ST or any other SCSI-capable

Yes - but how does this adaptor know how to present the data to the computer? Not all computers partition their disks alike. Plug it into a Mac and it will need to pretend to be a Mac partition. Plug it into a Mini, it hasn't a hope of knowing whats expected.

Of course it wouldn't be impossible to build a sort of hardware NFS solution which appeared to be a CD-ROM (hence ISO9660 format). However this would be pretty limited (how do you choose which remote partition to mount? Size of the partition limited to 680Mb or so) - and also you still need CD-ROM drivers. A nice hack for the Atari - but I don't really see any commercial advantage. The Atari has been very poorly supported in the networking area. This is now changing (with MiNT-Net and Linux/68k), and it makes sense to implement the Atari end in a flexible way that had more uses than just sharing files.

:-)

Roland.

Yes, of course this should work on the TT without changes (except that there
may occure some timing problems within the driver because I can't test it on
any machine faster than 16MHz).

Hello, all!

For all you GFA Basic programmers out there, I have stumbled upon
something that I get the impression has stumped many GFA programmers
for some time. I got the BMOVE command to do some VERY NICE
horizontal scrolling. With this, the posibilities are limitless! I
figured it out by accident while trying to write some code that would
deal with another scrolling problem I was having. However, when I
typed some certain stuff, and ran the program, it just scrolled
horizontally. So, I fiddled around until I had figured out how to
control it. Here is the code:

screen1% is the screen you start with, which you are moving FROM.
screen2% is the screen you end up with, the one you are moving TO.

```
Move the entire screen 1 screen to the right:
For I=0 To 80 Step 2
  Bmove Screen1%,Xbios(2)+I,32000
  Bmove Screen2%,Xbios(2)-32000+I,32000
Next I
Move the entire screen 1 screen to the left:
For I=0 To 80 Step 2
  Bmove Screen2%,Xbios(2)-I,32000
  Bmove Screen1%,Xbios(2)+32000-I,32000
Next I
```

Using a value of 80 moves the image one screen width
Uneven numbers for the steprate are VERY slow, so use even ones.
A step rate of 2 moves the screen at a fairly reasonable speed

Talking about handy tools, here's an undocumented command:
CURVE x1,y1,x2,y2,x3,y3,x4,y4
This commands draws bezier curves. :-)

>While I do very little GFA work anymore, I used to use BMOVE all the time
>(along with PUT, GET, SPUT and SGET) to build screens in the background
>(at a logical address) and then 'pop' them to the foreground (at the
>physical address). It's also a great way to simulate complex sprites.

A much faster way of doing this is to switch the logical and the physical
address. That way you only move a couple of bytes (and it isn't dependent
on the screensize).

This isn't a pirate BBS... we use real names here (more polite, ya know?)

At any rate, yeh, BMOVE is a handy tool in GFA BASIC once you figure
out how to use it without bringing your system down in a pall of smoke!

Your 'revelation' is not exactly new, of course, but poorly documented in the GFA references (as is everything else) so you are still to be congratulated for figuring it out for yourself.

While I do very little GFA work anymore, I used to use BMOVE all the time (along with PUT, GET, SPUT and SGET) to build screens in the background (at a logical address) and then 'pop' them to the foreground (at the physical address). It's also a great way to simulate complex sprites.

Of course, my book, 'The GFA BASIC Toolkit,' explained all this with plenty of sample code to insert into your own programs. Alas, it's out of print and I don't think Taylor Ridge Books will run any more of 'em.

Hi, does anybody know how .GEM (GEM vector graphic) or .CVG (Calamus vector graphic) file formats are put together? I'm trying to write a little GFA proggie which changes data into a graph. All I really need is to be able to put line-segments. I can then add labels in an art-package.

advTHANKSance, Tim

Good news!

All I have to do is sort the hardware out. I've located a spare DE600 -
just need the interface board.

Roland.

Hi,
Thanks to the people who replied to my previous post. I am considering getting NVDI ET4000 instead of coding my own VDI drivers, but I am not sure that it
would work with my DIY setup and I am also considering upgrading my SVGA card to a 64-bit accelerated one, so I will probably have to write some drivers anyway.

So, can anyone tell me how the VDI deals with colour resolution? I know that when setting up a palette, you specify RGB components in the range 0-1000, with 0 being none and 1000 being full-brightness, but does the VDI know or care about the colour
resloution of the output device ? Is there a standard way to determine the colour res.
of the output device so that applications don't try to allocate 20 palette settings
which all map to the same phsyical hue?

Cheers,
Joe.

: and like works without problems. The AES/VDI was never intended to work in
: this way. If you wish to use a specific resolution you should tell the user
: that in an alert box that appears if the the program was launched in the
: wrong resolution.

: If, however, you have an urge to accomplish a VDI resolution switch, I
: have some ideas on how to do it.
: Initialize the VDI in the same way AES does; it calls v_opnwk to open a
: physical workstation. You should open the screen workstation, I think it's
: number 0. Or perhaps it was 1...
: Anyway, you then use the handle you get whenever you draw using VDI
: routines. This will only affect the VDI - not the AES. So the alert boxes
: will probably not be centered on the screen, except from that they will look

This completely negates the whole reason I want to do this in the verst
place; It's for a program I wrote called LoadLow, and its whole purpose is
to allow you to drag-and-drop (or use as a .TTP) games onto it that don't
switch resolutions themselves, so that you can load them in the proper
resol;ution without _having_ to deal with those stupid alert boxes that tell
you to switch. So I'd actually _need_ to be able to reset the AES. I've
tried v_opekwk(0) and it doesn't do anything useful that I can see.

: okay.

ST Assembler is a WWW page that I'm working on at the moment. It will contain all the Atari ST/E hardware details that I can get hold off, and will contain at a later data Assembler code to demonstrate the use of the hardware.

I will be adding most of the information over the next few days, and then the source code bits over the next week. (Well depending on how fast I can type anyway).

The very small and not yet html'ed ST assembler can be found at:

http://www.bath.ac.uk/~py4sdh/index.txt

If anyone has any questions or want to donate info, articles or source code you can email me at:

py4sdh@bath.ac.uk

] Surely MiNT-Net can already do this? At least I can mount TT volumes on
] my Linux PC. I haven't tried telnet myself.

You have it in the wrong direction although the other way round would be
useful as well. But I'm not sure whether I really want to use MiNT on a
plain simple 520STM, even with a speeder installed...

]   > A great thing to have would be a SCSI-network connector that can
]   > disguise as a plain SCSI harddisk to the machine it is connected to.
]
] Yes - but how does this adaptor know how to present the data to the computer?

If it fakes a real harddisk drive it doesn't have to. This would be a raw
disk w/o a filesystem. The drawback would be that the exporting machine
won't be able to access the files itself...

Greetings,
                  Ripley

PS: Anyone out there know about a source for a DE600 adaptor ?

This is yet another classic example of Atari never fixing a problem
with TOS. From when the ST was introduced, users would have liked to
have the ability to change resolutions on the fly. Rumors about this
feature came before the STE, TT, and Falcon were released. None ever
achieved this. The only real problem I can see with changing rezs is
that desk acc dialog would have to adapt, and since desk accs are
external to TOS, that would make old, unsupported ones not work and
require a protocol for fixing the forms to the new rez for supported
accs.

: A neat trick - how was it done?

I've never tried this myself, but I think it works:
You know that you set the Timer B control register to 8 when you want it to
execute the interrupt every HBL. Then we have the delay mode (<8), for
instance setting the control reg to 1 means that the number of times the
interrupt occurs is divided by 4, thus making the interrupt occur every
fourth line.
But if you set it to >8, the effect will be the opposite. I.e. if you set
the control reg to 9 the interrupt will occur 4 times as often. This means
that your interrupt rout will not only be called after every line is drawn
(on a 320x200 screen that would be on pixel no. 320), but also on pixel no.
80, 160 and 240.

: above, but whoever left the above messages seems to know a bit about GFA
: Basic. I have no manual, only a quick reference, thus I am unable to
: figure out how to use the BMOVE command. How can it be used for nice, smooth
: animation? If you know how, please could you let me know.

Well, I believe the syntax is:

Bmove source adress, destination adress, length in bytes

So moving 32000 bytes from a string variable to the screen should be:

```
Bmove V:A$,Xbios(2),32000
```

If you want to make a full-screen animation you can keep all the pictures in a string array, and then copy them to the screen:

```
Scradr%=Xbios(2)
Do
  For Picnum&=0 to 9
    Vsync
    Bmove V:A$(Picnum&),Scradr%,32000
  Next Picnum&
Loop
```

Well yes it would be nice if I could do it the other way around, but the sad fact is that currently I can mount TT partitions on my Linux PC, but *not* the other way around. There is no good reason for this - I just haven't tracked the problem down yet. :-(

> Yes - but how does this adaptor know how to present the data to the

Okay - so I can see this working, but yet again why bother? If the exporting machine can't read the disk, then you might as well just connect a real SCSI disk instead of this adaptor. SCSI disks are cheap as people actually have a use for them. An adaptor as you describe doesn't seem to have a market. Well at least I can't see one.

> PS: Anyone out there know about a source for a DE600 adaptor ? --

Or in my case - the board to connect a DE600 to the cartridge port (or even a source for the PCB - or *even* a picture of the PCB ;-)

:-)

Roland.

I think that under MultiTOS there is a way of doing this. You can request that the sytem changes resolution. The system will then automatically shutdown all apps. that are running that understand this call, and Change rez. as if you had selected set video mode (on the F030). Many programs dont recognise this, and as, MultiTOS tells the calling program that the rez. change has failed.

I think that it works with DA's (these are treated as normal processes under MiNT.

I have not done this, but I have been reading M.A.S.S. to learn some of the new AES stuff. :-)

Yes, an application can inquire the actual device palette settings
from the VDI (mapped from 0 to 1000, as usual) There is no way to tell
apps not to create more than one palette entry with the same physical
entries (why should there be?)

Check the vq_color call - a flag parameter switches between returning
the VDI's idea of the palette entry and the hardware's idea of the
palette entry.

The easiest way (from a programming point of view) is to use GDOS to create your metafiles for you. Then all you do is open a metafile device (31 usually) with v_opnwk() then draw what you want to that device, then close it. That creates a .GEM file without you needing to know the format.

The format was documented in an old issue of ST-World, and also (I think) in the Atari Compendium, if you really feel you should roll-your-own.

Craig.

Hi, I am in the process of writing an extension for STOS for the Falcon. I have various bits
up and running, but am having trouble with the 256 colour palette. My poblem is, where are the
palette entries stored?

The hardware document (you know the one I mean...) says that they are stored in longwords from
$ff9800 to $ff98fc. How can this be? I make it 252 bytes - ie 63 longwords, not 256.

Where are they actually stored, and in what format?

Oh, and because it's STOS, I cannot use the VDI to set it...

Cheers

Anthony Jacques

I know a source for *expensive* DE600's ($280) here in Germany. If anyone wants
to know this I can look up the address. But I'm sure you can get it cheaper
somewhere.

The PCB's are available as HP plotter files from fortec.tuwien.ac.at. You
can use GNU's hp2xx-3.1.4.tar.gz (available from every GNU site, eg.
gnu.ai.mit.edu) to convert into something printable.

You could ask Peter Mayr (pm@fortec.tuwien.ac.at), the author of the adapter
hardware, whether the board is still available (it was in the past for few
bucks).

The driver for the DE600 is contained within MintNet 0.7, which is available
from my WWW home page from now on and should appear on a.a.u.e these days.

Kay.

I've edited the original text somewhat to make the lines readable.

In article <3g0l53$5d@m1.cs.man.ac.uk>,
Anthony Jacques <jacquesa@cs.man.ac.uk> wrote:
>
>Hi, I am in the process of writing an extension for STOS for the Falcon.
>I have various bits up and running, but am having trouble with the 256

>colour palette. My problem is, where are the palette entries stored?

You should not access the hardware directly if there is another way.

The XBIOS palette handling is something I think Atari should have spent
at least _some_ time thinking about. Not only did they spell the original
call wrong at first, but there are now _three_ different calls!

```
On the ST you have Setpalette  (originally Setpallete)
       TT          EsetPalette
       Falcon      VsetRGB
```

It's not difficult to write your own routine to convert and use the
correct call (email if you want C source), but it's embarrassing that
it should be necessary.

Anyway, on the Falcon you should use XBIOS 93 as follows:
(The xbios call format can differ between compilers and languages, but
 hopefully you have something very much like it. It's simply supposed
 to stack its arguments and call the XBIOS.)

```
  #define VsetRGB(a,b,c)      xbios(93,a,b,c)
  VsetRGB(start, n, map);
```

Where 'start' is the index of the first colour you want to change (16 bit),
'n' is the number of colours to change (16 bit) and
'map' is a pointer to the new colourmap array of longs (32 bit) 0x00RRGGBB.

To get the old palette values, use XBIOS 94 (VgetRGB) in the same way.

>Oh, and because it's STOS, I cannot use the VDI to set it...

If anyone knows how to convert between the VDIs colour indices and the
physical ones, I'd very much like to hear about it.
(I wonder if the programmer responsible for all this was a secret agent
 for that other company... ;-)

Technical point here : gcc recommends using the MinixFS, _NOT_ running
Minix. There's a fairly significant difference.

>: >If I want to program for the atari, it would seem logical that the compiler

>tends to be faster with Lattice because of the IDE.

Not necessarily - you work well within the IDE, so you may prototype faster
there. Lots of other people (me included) think the other way around;
Rather than have to live with the crummy editors built into every IDE
I've ever met, find a good editor and make it understand your compiler.
Add to this the things that can only be done with a makefile, and you
may begin to see what I'm on about.

>: Most "real" programmers that I know (me included 8) prefer commandline-
>: -driven compilers and shell-based tools. Their flexibility is their

>I disagree with this. Most environments have only recently gained usable
>GUIs, and so the current IDEs are in their first generation. A really

Most IDE's are in the second or third generation, actually. (arguable
as to what consititutes the various stages, but assume 1: wrapper program
for editor, compiler, linker, 2: builtin editor, compiler/linker/debugger,
3: add frills like syntax higlighting, class browsing, project management
etc.)

>nice IDE can speed application development substantially while retaining
>virtually all of the power of the CLI based solution - but there are very
>few around at the moment. The CLI solutions have been in use for a long
>time and are probably almost as good as they're going to get now. IDEs
>have a long way to go.

CLI solutions have been in use because they work 8). For a lot of people,
an IDE is unacceptable, or simply unworkable - for example, let's
assume that part of your code is automatically generated, say by a tool
that you or someone else has written; or perhaps you are using two
or three different compilers/languages for a project... These are
real-world scenarios that are more common than you may think,
and they all work best out of an open and flexible environment.

In the end, the best IDE will look like a window manager with a shell
and a few neat aliases.

>Having said that, I think a lot of Windows programmers (probably the
>majority of the software market ATM) would disagree - all of the major

>compilers are now IDE-hosted

And, oddly enough, all of them are commandline-callable.

Ok, are you running outside before mint, after mint or from the mint.cnf?
According to the shell I have about 12Mb free, but gcc just hangs. (2.5.8)

There is a flag argument to menu_bar. Passing a pointer to the menu tree
and passing 0 for the flag should work.

How I normally achieve this is to set all the Menu titles as disabled, appart
from the left most one, as this is used by multiTOS to switch applications.

This works fine...

Craig.

I don't suppose this patch will fix the Lattice 5.52 Menu bug under TOS4.02?
You cann't select any of the cascaded menu items at all (even though the
box says the software is falcon compatible). I've had to resort to manually
editting the project files to set compiler options.

Don't tell me to upgrade to a more recent version, the reason I bought 5.5
is that I cann't afford 160.00 quid for the latest version.

Craig.

Please don't delete this message or anything!

Our news server here at Imperial College is up the swanny and for two or so
months now I have been unable to post articles. So if you can read this
article, please respond by e-mail to the address below (in my .signature),
whether or not you can help me with my query, which is:-

BTW I do own a 1040STE, so I'm not entirely off-topic. Does anyone out there
know how to draw STOS sprites from Assembly language? Specifically
getting PUT SPRITE and UPDATE to work? The given traps (in the manual)
don't work... Thanks in advance.

Ozzy.

I know what you mean. I had to upgrade also...I bitched about the software
not truly being Falcon compatible and the fact that it didn't even have the
libs (which the box led me to believe), and at the time had no 'net connection,
so I had to pay for it :(No sympathy from Hisoft at all...I am less impressed
with them after that...

After getting a cross-compiler to work very well on an NCR System 3000
UNIX box (Intel-based), I started. Then AT&T GIS's (ie NCR's) new
version of UNIX came out, and it stopped working. I rebuilt it, and it
doesn't work. I tried building it on a Linux box, and I couldn't get
the binutils to build.

So I've stopped writing my cross-compiler cookbook. Pity, it was so
much nicer having a fast machine with lots of RAM to build my stuff on.

Subject: Scanner Programmer Needed
Newsgroups: comp.sys.atari.programmer
Summary: Have Transparency Add-on Need Software Mod
Keywords: Microtek, TT, MTSCAN, transparency

I have a Microtek Scanmaker II flatbed scanner which I use happily via the now unsupported MTScan software. As a gift this Christmas, I received the wonderful add-on to this hardware, the Microtek Transparency Adapter -- it just plus in to my scanner and replaces the old lid with one that needs to be activated by software.

So, I have my unsupported MTScan software which accesses the Scanmaker for scans of opaque media. And I have the free Mac software enclosed with the Adapter -- it provides a choice of opaque or transparent scans, i.e. it activates the new transparency lid.

Therefore, it is sensible to my mind for a programmer to look at both the Mac and the Atari programs and somehow enhance the latter to *simply* access the damn Transparency Adapter (which is now cheap and always has been nifty.) Such a job would be worth money to me and to others, I'd think. Any takers?

 I imagine it should cure this, since the incompatibility is due to
Lattice C using some AES handles that were not used in older versions
of GEM. Now Magic and newer TOS versions have stepped up their GEM
support these calls are clashing with the Lattice C hacks.

: Add to this the things that can only be done with a makefile, and you
: may begin to see what I'm on about.

The Lattice C editor is not too bad; standard key shortcuts, fully
automated indentation and so on. Still, I see what you mean. I think
there's been a bit of a misunderstanding, though; by commandline I
thought you were suggesting a full CLI text only system, whereas you seem
to be suggesting effectively using a GEM editor as your shell.

: >: Most "real" programmers that I know (me included 8) prefer commandline-

: Most IDE's are in the second or third generation, actually. (arguable
: as to what consititutes the various stages, but assume 1: wrapper program
: for editor, compiler, linker, 2: builtin editor, compiler/linker/debugger,
: 3: add frills like syntax higlighting, class browsing, project management
: etc.)

Well, I'd say that a stage 1 is a shell, not an IDE, and 2 and three
aren't all that different. I reckon that the second generation will have
properly integrated resource editors, kind of like Visual Basic but for C.

Visual C doesn't do this in my opinion. The NeXTSTEP system is the only one that I know about that can do this currently, and incidentally that is its major selling point.

: >nice IDE can speed application development substantially while retaining
: >virtually all of the power of the CLI based solution - but there are very
: >few around at the moment. The CLI solutions have been in use for a long
: >time and are probably almost as good as they're going to get now. IDEs
: >have a long way to go.
: CLI solutions have been in use because they work 8). For a lot of people,

CLI solutions work, yes, but you must concede that GUIs haven't been around long enough to allow the sophistication that long term development of an environment brings. The command line system we know has been developed since the start of Unix (and has its roots from systems before that), and so have been developed over a span of decades, not years.

: an IDE is unacceptable, or simply unworkable - for example, let's
: assume that part of your code is automatically generated, say by a tool
: that you or someone else has written; or perhaps you are using two
: or three different compilers/languages for a project... These are
: real-world scenarios that are more common than you may think,
: and they all work best out of an open and flexible environment.

I still can't see why a future, better IDE can't allow access to these features. There's no reason, for example, why an IDE can't extend over several languages.

: >Having said that, I think a lot of Windows programmers (probably the
: >majority of the software market ATM) would disagree - all of the major
: >compilers are now IDE-hosted
: And, oddly enough, all of them are commandline-callable.

Yes; I'd be interested to know the proportion that are actually used as such. Please don't misinterpret me; I think commandline tools are excellent in some situations, and I'm certainly not advocating always using an IDE. For the same reason, though, I wouldn't suggest that an IDE solution can never be better. I have both; Lattice C5.6 under MultiTOS and gcc 2.6.1 set up with MiNT/MiNTOS/MintNet/TCSH, and I use both regularly.

ATB,

Martin

> you get hooked on Modula 2, you might take a look at Turbo Pascal -
> Pascal is what Mod2 evolved from, but is basically the same.

Instead of making to move back to what modula evolved from, why not make the move forward to what Modula 2 evolved to. The newest language of Wirth is called Oberon-2. It still keeps pretty much the flavour of the older languages (porting to it from Modula is real easy), dropped a few constructs to make it easier to write really fast compilers (ARRAYs always start at zero, a few TYPEs and all the parallel constructs are dropped) and a few smart additions that make life a lot easier: No longer Definition and Implementation in two seperate

Files, the Compiler generates the Definition itself. Then there is a built in Garbage Collector (ever had troubles with wrong freeing of Pointers?) and last but not least a wonderful Objectoriented programming support by making RECORDs extensible
expl: TYPE pt = RECORD x,y : INTEGER END;
           ColoredPt = RECORD (pt) color : INTEGER END;
There are runtime constructs to test for a type (IF p is ColoredPt THEN .. END) and even typebased procedures:

```
PROCEDURE (p: pt)Draw BEGIN SetPixel(p.x, p.y, black) END Draw;
PROCEDURE (p: ColoredPt)Draw BEGIN SetPixel(p.x, p.y, p.color) END Draw;
```

called by p.Draw (Called according to the type of p).
If people like to hear more of this, I'll go on, this is just to get the appetite.

The best is, that there is at least one Sharewareversion of Oberon-2 for the ST residing on fileservers: STJ-Oberon.
It has libraries for all the AES/VDI/TOS stuff and even an application framework to write your own GEM-App with windows by simply extending a few procedures in the above style.
If you pay the 50 Mark Shareware (about $30) you even get a debugger (post-mortem source code debugger), all the sources from the libraries down to the garbage collector and the debugger and a load-time linking environment. (Note that I'm not the author and don't earn a cent writing this). There are a few bugs left in the system but it's still maintained, so be either mailing to the author or changing the sources of the libraries yourself you can fix them.
If any one is interested, I'll be glad to give more informations

What you want is PLAYBACK, this is availble from most FTP sites I think
and has source code for playing samples in GFA as well as hisoft basic
and others, Don't know about the DMA thing but it should work.

Oh yeah when the samples are playing it leaves the system free to do
other things which is pretty cool as most routines hold the system until
the sample has finnished. If you cant find the code I can post it on
here for you or E-Mail it to you, you'll have to let me know if you want
it and i'll dig it out.

Any other GFA coders out there with a collection of .LST and .BAS files
that contain routines that may be of interest to other GFA programmers
such as loading in strange formats etc, If so maybe and E-Mail list of
G.F.A coders could be compiled and posted on this group and anyone with

any GFA queries could just look at the list and E-Mail relevent people
to get code or help? Or alternativly is there somewhere GFA code is kept
on any FTP sites as I haven't found any yet P.D libaries seem to have
several disks of usful GFA source... Any one got any ideas??? More
importantly does anyone care??? On a difernt note any one know how to
decode and show a 256 color or greater GIF in 16 colours in GFA as I
need to do this for a WEB-Type Browser program I am working on?? If not
anyone know the file format??

Better to know what you know to-day than to think you know what will
happen tomorrow - Me

> clear it. I tried SCREEN$=SPACE$(32000) but this dosent work any one got
> any ideas, Oh yeah it's GFA V2.0...On an STE.....
Well, don't forget that the Screen of an ST/STE is a *graphic* screen, not
a simple terminal. So if you want to make it blank, you must fill it with
zeros, i.e. all pixels cleared. With space$, you've filled it with 00100000.
So just do screen$=string$(32000,chr$(0)) (or chr$(0), 32000, dunno the right
order now). But always remember that using SPUT/SGET will cause the program
to only run on fully ST-compatible screens, i.e High, Low or Med. Better use
VDI-calls to handle with the screen (I know, that's not easy with Gfa...) Of
course, if you can live with that, use SGET/SPUT...

Ciao

Thomas

I found some functions within support.h, namely unixtime and dostime functions
and want to use them within my own programs. Unfortunately when I seem to
compile it, it says it cannot find the functions..

Also there is a regular expressions library, and I can't find any instructions
on how to utilise it... any help that?!?!?

Any help would be greatfully received!

Hi there,

I believe that the sources for MiNT 1.12 do not compile "out of the box"
with Lattice C. Are there diffs available and what FTP site could I find
them from?? Also are these up to date with the latest patch? (1.12-h2) I
believe).

Cheers,

john

re. GFA FTP sites

I have started a small one on atari.archive.umich.edu under Programming/Gfa. There isn't much there right now but anything you send me I'll stick in it. I don't use GFA much anymore, but I have been slowly getting some of the code I have on my own machine up there. One of the items is a cheap litle demo I did for my local user group. It uses the BITBLT commands and the Playback routine.

Martin Schmidt (gd63@vision.hrz.uni-giessen.de) wrote:

: If I do windows (wind_create() and so on) there is a SIZER aviable on
: every window.

Well... of course, you could not specify the SIZER flag in the
wind_create call, then there would be no sizer at all. I assume,
though, that you do want a sizer, but allow only for a certain
range of sizes.

: If I allow AES to use it, then I get an anoying effect:
: It is possible to to change to size down to zero, and you can see it with the
: rubberband.

From my experience, there is some minimal size of a window depending
on what elements (TITLE, SIZER, arrows, sliders etc.) the window has.
A fully decorated window cannot be sized to less than 100 x 100 pixels
of workspace, but the workspace of a window with the flags TITLE | MOVER
| SIZER | FULLER | CLOSER can very well be shrunk such that (almost?)
nothing is left of the workspace.
I am not aware of any method make any assumptions on such limits
which is warranted by the AES specs, though.

: Of course, my PRG doesn't accent too small sizes from the AES, but
: still the rubberband can become so small.
:
: How can set a lower limit for the SIZE rubberband ???
: Is there a siple flag to set ???

None that I know of, sorry. AFAIK, all programs do just what you
say, they don't honor sizes which they don't like. It's nice, of
course, to get as close as possible to the desired window size,
i.e. you should modify the user specified size such that the size
finally set by you gets as close to the ones given by the rubber
while still meeting your constraints.

There is a program called prolog-68 that works quite happily on the Falcon.
I have been using it for several weeks now. You can get it from atari.archive,
I think it is in /atari/languages.

It's a while since I used GFA, but I think you could try:

```
SCREEN$=STRING$(32000,0)
SPUT SCREEN$
```

WHere can I get a copy of this and how much will it cost me?

Also, I heard "print out of OS" and "43 appendicies".. can anyone summarize
it, tell me when it was printed and by whom, etc??

Follow this posting (ie, don't e-mail) cuz others seem pretty interested
in it too..

thanx!

: any ideas, Oh yeah it's GFA V2.0...On an STE.....

SPUT is buggy, and I don't reccomend using it. It's also slow. Use BMOVE
instead. Try this:

blank.screen$=SPACE$(32000)

```
CLS
BMOVE XBIOS(2),VARPTR(blank.screen$),32000  ! Move blank screen to string
```

Now, whenever you want to BMOVE the blank screen to the screen, do this:

```
BMOVE VARPTR(blank.screen$),XBIOS(2),32000
```

It's blisteringly fast. I don't know if this will work with GFA 2.0, but I always use BMOVE with 3.5E for any main screen operations, and it works like a charm.

I think it's a good iea, personally. I'm a fairly adept GFA coder, though my main strengths are with graphics; I know little about using GEM in GFA (I try and avoid GEM wherever possible) but I know pretty much most everything else.

I have a list of picture formats if you're interested; it contains the GIF format breakdown, too.

Okay, I know all about res switching in GFA using setscreen ... that part's pretty simple. The part that isn't pretty simple is getting GEM to recognise the change along with the rest of the system.

Normally, I switch resolutions and the system works fine ... I set the mouse boundaries with LineA (I know, I know, but if you have a better suggestion, I'm all ears -- er, eyes) as well as the number of colours for that res... but if an alert box should pop up, it appears half off the screen as if GEM still thought it was in its previous res. I can turn in VDI clipping so that stuff doesn't wrap around to the other side of the screen, but that doesn't help alert boxes, which end up getting truncated half way. Any ideas? Thanks...

>Is there a siple flag to set ???

Very simple, set up some #defines for your minimum sizes and in the function
that processes your msg[] add:

```
case WM_SIZED:if (msg[6] < MINWIDTH)
msg[6] = MINWIDTH;
if (msg[7] < MINHEIGHT)
msg[7] = MINHEIGHT;
etc etc
```

Joe Tapply (jdmt@dcs.ed.ac.uk) wrote:
: HI,
: I have been trying for a while to connect an ET4000 based ISA SVGA card to
: my TT via the VME port, and last night I managed to get a proper picture out of
the
: VGA card. So far I have only 320x480x64K and 640x480x256 colour modes working,
: but I expect to end up with 640x480x16M and 800x600x64K modes as well.

: I want to get GEM/TOS to use the SVGA card instead of my TT's normal video , so
I
: guess that I will have to write my own VDI drivers for it. I can't really see
too
: many problems in writing 256 colour mode drivers, but how does the VDI deal with
: truecolour? Specifically, what should my VDI drivers return from a v_openwk or
: v_openvwk call to indicate that there are 64K/16.8M colours available? Also how
: should I handle palette related calls when there is no real palette?

: I hope someone can help,
: Cheers,
: Joe.

Well, the VDI documentation says about intout[39], palette:
 Number of available colors in palette.
    0= >32767 colors
    2= Monochrome
    >2= Number of colors

So naturally you should return the value 0 here. As to all the other values,
you should look it up in the VDI documentation and see what they should
return when in the graphics mode you are writing your drivers for.

When in true colour mode, VDI tend to work with a set of "pens" rather than
color palette. That is, you have a 256 color index that you can pick your
current drawing color from, but if you change the RGB color values for one
color, those pixels drawn with that color will *not* change, as is the case
with the normal palette-modes.

Interesting note, but not related to the original question.....

Does anyone know how GFA Raytrace managed it's trick with the switched resolutions?
Most of the screen is displayed in ST-Low (with palette switching to get 512 colours)
but the menu (about 1.5 inches at the right of the screen) is displayed in ST-Medium.
A neat trick - how was it done?

Craig.

Hi,

under which circumstances can I use a PAM's Net with MiNTnet ?

I have the PAM's Ethernet card (TT with VME, Mega ST with Megabus and
ST with DMA/extern), but only the ST/TT Net-Software.

Now I have to decide to buy TCP/IP and NFS from PAM's (>400US$ per license)
:-(((

_or_

install just MiNTnet to have all the fine TCP/IP run with MiNT.

So, what do I need to use the Ethernet with MiNT ???

Thanks in advance for your help

Martin

CLISP runs on Atari ST, among others. Full Common Lisp.
FTP ma2s2.mathematik.uni-karlsruhe.de:/pub/lisp/clisp/binaries/atari/

If it doesn't run on the Falcon, please tell me.

I have a query related to this topic, although it's nothing to do with the above, but whoever left the above messages seems to know a bit about GFA Basic. I have no manual, only a quick reference, thus I am unable to figure out how to use the BMOVE command. How can it be used for nice, smooth animation? If you know how, please could you let me know.

Thanks in advance.

BTW do .XIF drivers exist for any parallel port ethernet adaptors? Also
is there any support for this sort of stuff under Linux/68k?

Thanks

Roland.

I have a problem with a progam which uses the following pieces of code...

```
typedef struct customers {
                        char c_num[MAX_NUM];
                        char c_name[MAX_NAME];
                        char c_address[MAX_ADDR];
                   } c_list;

c_list customer[DSIZE],temp_cus;

void add_customer()
{
char s[0];
         printf("Customer Account Number/Code : ");
         gets(temp_cus.c_num);
         printf("Customer Name : ");
         gets(temp_cus.c_name);
         printf("Customer Address : ");
         gets(temp_cus.c_address);
}
```

=======

On keying in h above information as prompted nte add_customer
routine the input into the temp_cus.c_name is ALSO appended on
to the temp_cus.c_num.

Can anyone explain?

Rod

```

Your most obvious problem is using gets() instead of fgets(). fgets() you force an upper bound on user input. In the above, what happens if MAX_NUM is, say, 8, and the user types a 10 char string?? Righto... Note that fgets() retains the ending newline (i.e does *not* replace it with a '\0', as gets() does), so you have to make the input fields one char longer, or follow the next suggestion, and remove the \n before copying the user input to the struct fields.

Instead of using the struct-fields directly, you could also use a temp buffer to hold the input. This allows for input-format checking, before overwriting data in the struct (for example). Still use fgets() though...

Okay. I'm not a pro but I enjoy trying to figure things out and actually
writing a program or two. But I'm stuck here.
I've been using GFA 3.6tt on my Falcon and I know there are some
incompatabilities but most of it works and I like GFA (now if they would
just upgrade it instead of spreading rumours).
One thing that doesn't work well is the old GET and PUT commands. Too
much for a little string. So I have to move on to something else. BITBLT
looked like the perfect replacement but I cannot entirely understand how
to do the same things I did with GET/PUT. I can move a block or section
fo the screen around nicely but what I need to do is copy into a
string(?) and display it later, as with GET/PUT. I have a little source
code for it but I can't seem to figure out how to store the section of
screen I need for later use.

I would appreciate any help on this.
    You see I am already balding
    and I cannot afford to lose any more hair

I have recently implemented a simple mouse controlled image scrolling
mechanism in MGIF. To make this really useful the user must be able to
scroll around the image no matter how large it is. Unfortunately GEM
restricts the pointer movements to the screen area, so any attempt to
scroll indefinitely to the right for example will fail.
Since I'm currently using the mouse to select points on the screen,
I want the screen to be still when the mouse is still and scroll when
the pointer reaches the edges.
I'm not doing this in a window, by the way.

To solve the problem I thought that it would be a simple matter to do
a programmed return of the pointer to the screen center, but I can not
find any way to do that. I thought it would be possible to use
appl_tplay (or whatever the name is), but since mouse movement isn't an
event that would not work.

Do I have to intercept the mouse vector or is there a better way?

I'm currently using graf_mkstate in a tight loop, which is of course a
bad idea under a multitasking OS. I'd like to use event_multi if possible.
Can event_multi be used to detect general mouse movement?

For normal image viewing I guess a start/stop kind of scrolling should be
enough. I think this must be possible using the box checks in event_multi,
but if anyone has any other ideas, I'm all ears.

: just upgrade it instead of spreading rumours).
: One thing that doesn't work well is the old GET and PUT commands. Too
: much for a little string. So I have to move on to something else. BITBLT
: looked like the perfect replacement but I cannot entirely understand how
: to do the same things I did with GET/PUT. I can move a block or section
: fo the screen around nicely but what I need to do is copy into a
: string(?) and display it later, as with GET/PUT. I have a little source
: code for it but I can't seem to figure out how to store the section of
: screen I need for later use.

Well I don't know how the BitBlt command works, but I know how you should
store whatever you've got.
A string cannot carry more than 32767 bytes, making it difficult to work on
the big screens of the F030. The solution is to use Malloc to allocate
memory. But first you have to make GFA release some of the memory it has
stolen from the system.

Let's say that you're working on a 256 color, low-resolution, overscanned
screen (384*240*256), then you would do as follows:

```
Screensize%=384*240*1  ! Size in bytes of the screen
Reserve 100000         ! Leave all memory to the system, except for 100Kb.
adr%=Malloc(Screensize)! Allocate memory and get the adress in adr%
If adr%=-1
  End              ! If there wasn't enough memory then exit
Endif
```

Then you have the adress to the block of memory and adr%, just as you get
the adress to the string using Varptr(a$).
When you don't need the block of memory anymore you can use Mfree do
deallocate it:

```
Mfree(adr%)
```

There is one of the best compilers on any platform named gcc. It supports
c, c++ and obective c (last one only on v 2.6 and higher). There are
quite a lot of libraries available on ST/E/F/TT for gcc on
atari.archive.umich.edu (gcc is available there too).

That would be a copyright violation (= piracy). You need to buy the disk, which costs all of UKP 2.50. Snail to Prospero C Disk, ST Review, Media House, Adlington Park, Macclesfield, SK10 4NP, UK.

Hurry though, because ST Review has just gone down the tubes, so the disk may not continue to be available for long.

Well Dave,

At home I use GCC running under the Mupfel shell supplied with
GEMINI. It is also possible to use it with Gulam (For which a setup
batch file is provided with GCC)

In my opinion GCC is VERY good - and if you are used to unix c at
university then you would find GCC very easy to get on with.

By the way - I do not and never have used Minix or Mint - all my
stuff is done under 'single tasking' TOS 1.4

Hope this was of use,
Beric..

What to you need to run gcc ? I was told that you'll need at least
2 MB Ram. Is it true ? I only have a very old 1024 and there is no
extension of the RAM possible. Just wondering.
BTW, has anyone setup cross-compilation with gcc (WS->1024) ?

ThX.

Marc.

I'm not sure of the names, but they're probably under the "Os" directory
at the UMIch archives (atari.archive.umich.edu). In the atari/8bit
directory. If not, they may have their own "Spartados" directory..

good luck!

Frederick, if you don't get something worked out with this info, mail me and I will send you some sample source code. I just recently figured out how to do this and yes you need to malloc a block of memory to blit to instead of using a string.

Not to knock unix machines, I use them at school... but... why is it that all the shareware C compilers (or, at least the ones that I have had recommended to me) are extremely unix-like in nature? They even go so far as to recommend running minix, because of the irregular filename lengths. They are huge executables, and must remain in certain paths with many flags turned here and there and about a BAJILLION different configuration files, etc, etc...

If I want to program for the atari, it would seem logical that the compiler should run under GEM/TOS..

This is rather "turn-offish" for me, since in order for me to do any kind of real programming, this means I have to fundamentally change my computer's file structure and operating system. And since I am still quite the newbie when it comes to a unix-style command-line interface with flags here and there and man pages left right and centre, should I make the transition?

What kind of a setup do <quote> REAL <unquote> programmers use? Should I be working from the mainframe at university, and attempt to find some kind of flag or option to compile for the 680x0? Or should I attempt to set something

up using minix? Help required...

perplexed,
Dave

On my f030, I use Lattice C for my application development as it compiles
quite fast & runs properly under GEM without using loads of memory.
CLA is developed using that setup.

I also have GCC2.3.1 installed on a minix partition (MiNT1.11h2) with
Xwindows for MiNT for doing any Unix oriented stuff.

Craig.

Does anyone know how to disable access to the menu bar while still
using EVNT_MULTI to get user input? In GFA there is a MENU KILL command,
but the ~MENU_BAR equivalent of this doesn't seem to work.

Thanks,
 RandyH

The latest versions I've seen are 2.6.1 for MiNT and 2.5.8 for non-MiNT
systems. Haven't seen any ready-to-install bundles of these versions yet.

The directory at umich (GnuStuff/...) has all the files you need.

Revision 5 (as of Jan. 5, 1995) of the UNOFFICIAL ATARI 8-BIT NEW USER /
EMULATOR HELP FAQ has been posted to the following newsgroups:

   comp.sys.atari.8bit
   comp.emulators.misc

It's about 43K and covers basic Atari 8-bit stuff, basic usage of PC Xformer, the Atari 8-bit emulator for IBM PC's (produced by Branch Always Software; PD versions 2.0 and 2.5 are available via FTP; the commercial version retails for $29.95 (v.3.0)).

It is also a referall to the comp.sys.atari.8bit FAQ file and lets you know what software to get and manuals to read (MyDOS, SIO2PC, S2PC, AtarImg, DCM2Dsk, etc.)

Have fun!

Well, the main <shareware> compilers that I have been pointed to are sozobon
and Gnu C.. Somewhere in the documentation of GCC, it recommended minix.
configuration files might be a slight exaggeration, although it DID recommend
that certain files be placed in certain paths (none of which currently exist
on my system- such as /usr/bin/lib/whatever...)

>>If I want to program for the atari, it would seem logical that the compiler

I know this is for atati programmers, but I could use your help anyway.
I have an obviously ancient atari 400 that I'm fixing up and need a
replacement keyboard. I live in the Sacramento area, so if anyone has
any suggestions on how to get a hold of this particular part, could you
please write me a note? Your help is much appreciated!

Meredith

I have never met an atari C compiler that has recommended running minix.
Most of the C compilers around are unixlike because that's where they
come from in the first place. Of curiosity, what compilers have you been
pointed at? I don't recall any that require any configuration files at
all.

>If I want to program for the atari, it would seem logical that the compiler
>should run under GEM/TOS..

Not really. You want a compiler, not a video game.

>This is rather "turn-offish" for me, since in order for me to do any kind
>of real programming, this means I have to fundamentally change my computer's
>file structure and operating system. And since I am still quite the newbie
>when it comes to a unix-style command-line interface with flags here and
>there and man pages left right and centre, should I make the transition?

Depends. Learning to program involves a huge shift in the organisation of
your brain - you're one ahead with your machine because you can at least
make backups and restore if it's all too hard.

>What kind of a setup do <quote> REAL <unquote> programmers use? Should I be

>up using minix? Help required...

Most "real" programmers that I know (me included 8) prefer commandline-
-driven compilers and shell-based tools. Their flexibility is their
strength.

Check out the Vendors/Developers List on comp.sys.atari.8bit (newsgroup)
for some Atari dealers and repairers in the bay area. I'm sure one of
the companies around here can fix (or replace) your 400, or upgrade you
to an 800 or an XL or XE!

Good luck!

Newer version of gdb (since 4.0) use the BFD (Binary File Description)
library as an interface to the executable format. But nobody has yet
written the support for the native GEMDOS (st-out) format, which would
be required for gdb to read the executable (even if there is a
separate symbol file in a.out format). The changes to gdb 3.6 (which
is the base for the current gdb for atari) to support the st-out

format are a gross hack that does not work for BFD. That's why we
currently must live with the limitations of gdb for atari.

Andreas.

My gdb cannot correctly debug c++ programs compiled with gcc. It writes
that it can't understand multiple inheritance. So the problem is while
inspecting classes with multiple inheritances - only the first
inheritance is visible then for gdb. Is there anybody, who know abot any
newer version of gdb (without this problem)?

thanx for any help,

Simon.

GNU C++ is the only C++ compiler available for the Atari, and will
probably remain so... a commercial C++ compiler was almost done, but
appears to have vanished.

It's very good, but really requires a Falcon or TT with more than 4M of
RAM; it's VERY tight on an ST, and very slow.

I would be interested in setting up gcc on a Sun as a cross-compiler
for STs/TTs; does anyone have any easy-to-use-by-numbskulls
instructions on doing this?

I've ported the Xvt xterm replacement to X11R5 for MiNT.

It's up & running, and you can run one copy (it takes about 1/3 of the
memory an xterm requires) but I still have a few problems:

1) You can only start xvt from an xterm window, if you start it direct from

twm, the Xserver hangs.

2) You can only run one copy of xvt, when you try to run another you
get a 'cann't get a pty' message.

But, it does work to an extent & is very stable (the problems above are
the only ones).

Any suggestions to fix the above appreciated (I'll be uploading a source/
binary distribution RSN).

Thanks to Andreas Kirschbaum <ank@rbg.informatik.th-darmstadt.de>
for telling me about the stack size fix, all the problems I had with
xvt crashing went away as soon as I ran 'fixstk 10000' over the
executable....

Craig.

There are three "big" Atari dealers in California, any one of which probably
would have a replacement keyboard for the 400. They are:
American Techna Vision. 15338 Inverness, San Leandro (510) 352-3787
B&C Computervisions. 2370 Scott Blvd. Santa Clara (408) 986-9968
Best Electronics. 2021 The Alameda Ste 290. San Jose (408) 243-6950

Call first. BEST has everything, but their prices tend to be a bit higher.
They also carry a memory upgrade for the 400; it will give 48k.

Perhaps I'm not a 'real' programmer, but I like IDE's to develope with.
If I could get an enviroment as nice as the one in Pure Pascal, but for
C, then I'd never touch a command line again. I like to be able to hit
one key & have things compile, link and drop straight into the debugger
with all my watch windows at the ready - bugger all this typing on a command
line. The only time I use command line based compilers is if I'm fannying
about with MiNT or X Windows (and I'd use an IDE for that if GCCshell was
a bit better).

Craig.

Michael Smith (miff@apanix.apana.org.au) wrote:

: I have never met an atari C compiler that has recommended running minix.

Actually, the latest version of GCC does, and (I believe) has currently
been only ported for MiNT. It is true that most GCC programmers run MiNT
on quite powerful machines; certainly I could never get a really
satisfactory system without MiNT.

: >If I want to program for the atari, it would seem logical that the compiler
: >should run under GEM/TOS..
: Not really. You want a compiler, not a video game.

He's got a point here. If you're programming GEM stuff (which I do quite
a lot), you need to be able to compile and run in the same environment. I
cannot compile GNU C (and particularly C++) programs of any reasonable size
with GEM loaded, so I use Lattice instead. And prototyping _any_ program
tends to be faster with Lattice because of the IDE.

: >What kind of a setup do <quote> REAL <unquote> programmers use? Should I be
: Most "real" programmers that I know (me included 8) prefer commandline-
: -driven compilers and shell-based tools. Their flexibility is their
: strength.

I disagree with this. Most environments have only recently gained usable
GUIs, and so the current IDEs are in their first generation. A really
nice IDE can speed application development substantially while retaining
virtually all of the power of the CLI based solution - but there are very
few around at the moment. The CLI solutions have been in use for a long
time and are probably almost as good as they're going to get now. IDEs
have a long way to go.

Having said that, I think a lot of Windows programmers (probably the
majority of the software market ATM) would disagree - all of the major
compilers are now IDE-hosted

ATB,

Martin

I'm not sure it's necessary to move the mouse at all. Just detect when it has hit the edge of the screen, and after a suitable delay (.2-.5 sec) do a scroll increment. Pause, check, then scroll again. The mouse stays put at the edge of the screen, and the user moves it back (and your cross-hairs) when it's gone far enough.

But I can see where you might want to move the mouse a _bit_ inward, say 8 pixels (or whatever) to correspond to the amount you've scrolled the image. However, this would lead to the user having to continually slide the mouse farther and farther, to make up for the offset adjustment that you've made. I don't think that's a good idea.

> I thought it would be possible to use
> appl_tplay (or whatever the name is), but since mouse movement isn't an
> event that would not work.

Mouse movement is an event (remember the bounding boxes, and MU_M1 and M2 flags?). It's also possible to generate with appl_tplay (ap_event 2), although there are a number of errors in the documentation I'd have to look up to tell you how to use it for sure.

If you _do_ decide to go this route (I don't recommend it), let me know and I will dig up the information for you.

> Do I have to intercept the mouse vector or is there a better way?

Don't do this. There's almost always a better way.

> I'm currently using graf_mkstate in a tight loop, which is of course a
> bad idea under a multitasking OS. I'd like to use event_multi if possible.
> Can event_multi be used to detect general mouse movement?

Sure. Just enable the MU_M1 flag as mentioned above and set your bounding box appropriately. Let me know if you need any more info.

On Merit/UMich, the SpartaDOS files are in the 8bit/Fte subdir, rather than the Os subdir where you might expect them (and where MYDOS is, for ex.).

Hi All,

  Appologies if this is the wrong group for this question...

  Can anyone tell me where to get the patch for Lattice C that will
  allow me to use it under Magic. The problem is that Lattice C uses
  some of it's own AES calls for the menus which clash with Magic's
  ones.
  I remember reading in a mag sometime (ST Review) that there was a
  patch, but can't remember if they gave a source for it.

  Any help would be appreciated...

Beric.

I must be really excited about this project to be posting a message about it here at 3am in the morning!

Anyway, for those who haven't seen my babble about this before, this is a HyperCard (a Macintosh program) clone for Atari 8-bits. Those of you familiar with HyperCard, MacroMind Director or other Mac (and maybe MS Windows) programs, or with CardStax for the Atari 8-bit will know what the program does in general.

To summarize it best I can, it's a program which presents the user with "Cards." Cards are screensful of information; in text and in graphics (which in itself can of course contain more text). They also contain intelligent "buttons." These buttons can look like whatever you want (either by having them drawn into the graphical background, or adding them from smaller graphics files (I'll hopefully have Print Shop Icons and Daisy Dot III fonts supported at some point)).

When you "click" a button (move the arrow pointer over one and press the [Fire] button (it currently only supports joystick), something happens. The most basic occurance is the card will change. Buttons will be different, the pictures will be different, and the text will be different. (Well, strike those "will"s and turn them into "may"s.)

What's the purpose? Well, the two biggest uses I see myself putting HyperIt! to are tutorials and games. The tutorials will be graphical and interactive, both very 'hip' these days, and the games will be more role-playing, educational or adventure, since it's not exactly an arcade-game designer's environment! Those of you who have seen games like Myst, Seventh Guest, and the more graphical Zork-ish games can imagine what the games in HyperIt! would be like.

For those interested in history and technical information, it's being written totally in Action! (the very famous C/Pascal/BASIC hybrid language for Atari's released by ICD back in 1983) so it's pretty fast and flexible. Although the 48K is being eaten very quickly, it still supports high resolution graphics; including a 1K screen font, the 8K of graphics, and even an 8K snapshot (to reduce disk access when going from one card to the next; you can make a graphical background and no matter how many cards you have which use it, they'll never need to load it again!).

The reason I'm writing the program is because I made a rather large HyperCard Birthday Card for my girlfriend a few months ago, so I became familiar with (and even <gasp> fond of) the HyperCard environment.
I decided I'd like that type of program for the Atari 8-bit. There's a lot of potential.

The second reason I'm writing it is as practice for when real code will start being made for the ADOS project (talk to me later about that if you care; it's going to be (if it happens!) a GUI environment for the 8bit Atari).

The third reason is because I saw David Paterson's "CardStax" program (after I FINALLY got a copy of it! I was quite impatient about getting a working copy as I really wanted to see it!) and found that since it was in BASIC, it was a bit too slow to react, and that the editor was far too confusing to deal with (well, of course I never read the instructions, but with HyperIt!, you work in a scripted language which is fairly flexible. The syntax looks horrid (parameters for a command are place on the lines following the command; separated by End-Of-Lines rather than Spaces or Commas!) but a quick editor could be created to give the user a better editing interface than a text editor, trial and error and patience! :)

(Well, I didn't expect a screenful of "reasons I wrote this," but there it is! :))

Anyway, if anyone would like to Beta-test it, I've been testing it without the Action! cartridge, collecting all of the files and ARCing it up every day or so (mainly so my current non-volunteered beta tester, David Paterson <grin> can take a look at it and tell me what he thinks).

The current ARC including source code and a sample stack is approx. 47k and the program currently requires MyDOS 4.5x (I use 4.53, so if you use something else, I can't promise it will work properly!)

Thanx for listening!

-bill!

Has anyone been successful in running GCC under Outside?
I had been intending to use outside to provide lots of virtual memory for
GCC to compile in, but whenever outside is installed GCC just hangs at
seemingly random points.

> When you don't need the block of memory anymore you can use Mfree do
> deallocate it:

```
> Mfree(adr%)
```

> -Mattias Flodin-
>

Hi!
This may be done in a different way, like this:

```
dim screen%((384*240*1)/4)   ! Reserve (384*240*1)/4 longwords = 384*240*1 bytes
adr%=V:screen%(0)            ! Get the adress for the dimensionised screen%()
```

This way you'll have the adress in adr% but you wont be able to change the size of the memoryblock with your program so this is only useful if you know how much you want to reserve when you write the program.

Tomas

There is extern int _app that is set to 0 if started as an accessory,
and to 1 otherwise. This is a feature of the startup module that is
linked in automagically.

Does anyone know if GFA was ever ported to the PC? I know there was some talks of doing so, but never heard if it was actually done.

I have tons of code I have written, and which I wanted tp adapt on the PC world.

Thanks in advance,

Youness

Can anyone recommend a good C or Prolog compiler for my 2Mb STe.

Both would be helpful with coursework for my degree (I'm a student).

Thanks in advance

Adrian King (aking@cs.strath.ac.uk)

gcc is pretty much the standard when it comes to C compilers on the
Atari (and it's the only C++ compiler around), but it really needs 4Mb.
Sozobon C is a good K&R compiler, available by ftp from a.a.u.e. or
hensa. Lattice C is probably the best commercial compiler, but if you
have any money to spare I would recommend getting some more ram and gcc
rather than buying a compiler.

I think there is a Prolog interpreter on a.a.u.e.

GFA was ported for the PC to run under Windows and DOS I believe, there
was a short review I once read in an old issue of Computer Shopper.

Unfortunately I do now know who to contact as I am not a GFA User, but if you don't mind a long distance fax or phone contact:

Richter Distributor
(2332) 2706 or fax: (2332) 2703

and ask about GFA for the PC, while they may or may not offer it, they can certainly help tell you where to get it, as they were meant to continue the Basic 4.0 (or was it 3.0?).

Cheers

Yat @ Lexicor

: 25 Bget #1,Adr(A$)+X,5760
: 26 Goto 100:Rem REM THIS OUT TO DEBUG SCREEN
: 27 Dpoke Start,Adr(A$)+(15*240):Goto 27
: 100 Get #2,A
: 110 Loc=Loc+240:Rem PAGE FORWARD
: 120 If Loc>Top+5520 Then Loc=Top
: 130 Dpoke Start,Loc:Rem MOVE START OF SCREEN MEMORY
: 140 Goto 100
```

If I remember correctly you cannot cross a 4k boundary in memory with screen memory for ANTIC. The string is greater than 4k, so this is guaranteed to happen, but even if you shortened the string, it could be that the string might happen to start 1 byte or so before the next 4k block of memory, thus messing up your first screen. The real solution, which I saw in some magazine or another years ago is to change where the string points to by modifying its entry in the variable value table to point to an address above everything else which is X bytes from the end of the end of the 4k block of memory it is placed in, where X is evenly divisible by your screen size in bytes. Another option to modifying the variable value table is to DIM the string with one screen size worth of extra bytes and then find out what address the string starts at and only use it starting at that address + whatever offset is needed to be X bytes away from the next 4k boudary in memory, where X is defined as above.

I hope this helps and I hope I'm right,

Yep, there was indeed a port for both DOS and Windows. At some point, they ran an ad in some magazine advertising a free trial demo disk. I called them up, and managed to get them to send it to me (they seemed a bit reluctant, at least until I specifically mentioned the ad). As I recall, I received two floppies. I never did try to port any ST GFA code over, but I did try out their demo programs. They looked all right I guess, but by that time I was moving over to C. Besides, they wanted about $150 I think, which I just didn't have. I still have the floppies somewhere.

This is good, I have been learning ansi C from the start. I have a hunch this is why I am having trouble compiling with sozobon (is it ansi c?). Which brings me to another issue: falcon compatability... sozobon doesn't crash, but I hear pure C does not work on the falcon.

I have pure C on my Falcon running under MiNT 1.12, everthing bar the
debugger works perfectly. Mind you there is one problem all the docs
are in German. Still it seems a nice package.

There's a Sozobon v2X (<- note the X) which is much enchanced version
of the old Sozobon. Although it's not 100% (no prototype checking and
single precision doubles...) it accepts ANSI-C code. There's also
available a port of mintlibs for Sozobon and a port of c386 (named c68)
free ANSI-C compiler (ie. full prototype checking) which uses the same
assembler and linker as Sozobon X.

Sozobon v2X is available for example on ftp.uni-paderborn.de.

PS. GCC v. 2.3.3 runs with less than 2MB free memory available. GCC v.
2.5.8 needs more.

aes.h and gemlib.lib (or something to that effect). So put the lib in your
prj-file and #include <aes.h>.

Does anybody know whether GNU RCS (the Revision Control System) has been
ported to TOS, and if so, where I can download it from? I recently started
using it at work, and seems pretty useful for the small programming projects
I do at home.

Thanks in advance,

Jaap-Henk

I recently came into possesion of a piece of hardware driven through
TT's VME port. Unfortunately, the software that is supposed to drive
the hardware doesn't seem to work, (I _think_ it worked once when I

tried it, but I mostly get bombs).

The area where the program gets stuck has the following instructions:

```
move.w   #$ff,$feffffe0
move.w   #$ff,$feffffc

move.w   #$0,$feffffe0
move.w   #0,$feffff8
```

Any of these instructions may bomb - or cause a complete hangup if viewed in pure debugger.

Does anybody have any ideas what is going on here? Are the absolute adresses the guy uses connected with the VME port?

Any, and I mean _ANY_ ideas would be extremely welcome.

I don't think the Salem, Mass, office is open anymore. I got a flyer in the mail the other day promoting their new GFA for DOS compiler and it was from an address in Conneticut, I believe. Their 800 number used to be 800-766-6GFA but I don't know if it's still working.

Problem : I have to call Mac Warehouse in Ohio, USA who have an 800 number only for Customer Support, and this is impossible from Sweden,where I live. I bought a Syquest 105 Mb removable HD there in Februari and need to call them to get a "RMA" number to be able to send it back to get fixed.

Sollution : Could someone reading this newsgroup (I'm into Jaguar and Atari myself so I now there's a lotta people out there) help me call them up ? My american friends are on christmas holidays (!) So I just need help to call the free 800 number, tell them the "fast service number" and order number and ask for the "RMA number" and email it back to me.

IF you want to help me - send an email and I'll mail you the number and details to get going.

Greets and Merry Christmas and....
hope to get some help

Would it be possible to use the Falcon with its da/ads and dsp etc to build
some sort of "almost" sorround sound decoder? (I guess for a proper one,
one would need a couple of more audio ports) Does any one know if the Falcon
it quick enough to do it? (if it had some extra audio ports?)

I found a bug in GFA Basic 3.6TT :-(

the code:

```
n&=10*FRAC(x/10)
PRINT n&
PRINT 10*FRAC(x/10)
```

where x=23 or x=33

In both cases there will be printed a 2 and a 3.
This is the same when you use N&,N|,N%

Only when n is used the correct answer (3) is given...

Damn!

Xref: nntp.gmd.de comp.sys.atari.8bit:18109 comp.sys.atari.programmer:83

Ok, I'll admit it, I'm working on an Adventure clone for the XL's.. here's
my problem.. I can't seem to get page flipping done correctly when
it comes to adding extra players to the screen. I'm stealling the
idea used with the 2600 version (or at least what it looks like they
did) and have everything split up like this:

There are 13 objects: 3 dragons + 3 keys + 1 Sword + 1 Magnet + 1 Bridge
  + 1 Door (per screen) + 1 Bat + 1 Chalice + 1 Player

The player can be handled by missiles or a missile.

That leaves 12 objects. There are 4 players allowed on a screen, so

what I did was divided the visible objects into three frames.

```
In frame 1, you see:  Dragon 1, Key 1, Sword, Door; if they're there.
         2, you see:  Dragon 2, Key 2, Magnet, Bat; if they're there.
         3, you see:  Dragon 3, Key 3, Bridge, Chalice; if they're there.
```

I know that PMG pages must be multiples of 1K for it to work (ie, if you say 20480, 20481 ... 20736, 20737 ... 21503, it'll not care and act as though you said 20480 was the PMBASE page.)

I didn't realize the paging was 1K, and thought it was 256 bytes, and it ALMOST worked like that.. But two of the frames had the same objects! They were in the same vertical place, of course, but in different horizontal places and of different colors. (The code to do the paging does this: Changes all horizontal locations of the players, Changes the PMBASE, and changes all colors of the players)

Now, I can go around this and just swap in and out 512 bytes of data per frame, but it's SOO much faster just to page through it! What do you folks think? Can you help!

I can post the code, if you want.. it's sorta sloppy (all the debug crap I did) and it's in Action!.. Also, I tried two ways of allocating memory; one was to make an array and have the PMBASE point to the first 1K boundary within the array (I made the array 1K bigger than how much of it I'm going to use), the other was to do PAGE=(DLIST/4096-1)*4096, like Mapping described.. Neither works when my pages are 1024 bytes, I just get a blank screen (no PMGs). When I change the pages to 256 bytes, I (as I said) get two frames with the same objects and vertical positions! :(:(

HELP!

thanx!

Has anyone got code to handle a CUA-style "combo-box"? I'd be
especially interested if someone had implemented it as a GEM++ object...

A combo-box is a object like this:

```
+-------------------------+----+
| Text Field              | ## | <- button
+-------------------------+----+
```

When you click on the button, a list box is presented:

```
+-------------------------+----+
| Text Field              | ## |
+-------------------------+----+
| Item 1                  | /\ | <- up-scroller
| Item 2                  | ## |
| Item 3                  |    | <- scroll thing
| Item 4                  | ## | <- scroll bar
| Item 5                  | ## |
| Item 6                  | \/ | <- down-scroller
+-------------------------+----+
```

When you select an item from the list, the list box disappears, and the
text field is filled in with what you selected.

I was going to start implementing one in GEM++ this week, but if
someone's alreay got code to do it, I'd love to see it. I'm considering
an approach like this:

The text field is a static text field or a text entry field, it doesn't
matter. The button is selectable and exits the dialog. When you click
the button, a window pops up, with 7 selectable objects in it, and the
only gadets on the window are the vertical scroller objects. As soon as
one of the selectable objects is clicked, the window goes away, and the
"text field" is replaced by the selection.

Now that I'm thinking about it, the "text object" would just be a GEM
OBJECT, and the things in the list box would be GEM OBJECTs too... then
you can put _anything_ in the combo-box. (This is all really, really
easy to handle with GEM++.)

Any comments?

: n&=10*FRAC(x/10)
: PRINT n&
: PRINT 10*FRAC(x/10)
:
: where x=23 or x=33
:
: In both cases there will be printed a 2 and a 3.
: This is the same when you use N&,N|,N%
: Only when n is used the correct answer (3) is given...

GFA certainly has some bugs, but I don't think this is one of these.
This is a normal rounding error. Recall that the result of x/10
(2.3 or 3.3, respectively) is a recurring binary, although it is not
a recurring decimal. GFA or the FPU are allowed to cut off the mantissa
such that the floating point number is smaller than the real result.
Now, the GFA manual says that floats are rounded down when they are
converted to integers. So, the result of 10*FRAC(x/10) can legally
be $1.7fff * 2^1 rather than 1.8000 * 2^1, and GFA is correct in
rounding the former down to 2.
You can test this hypothesis by replacing n& with n and adding the line
PRINT n-3 to your code. If above speculation is true, the result should
be some very small but negative number (like -1.234e-56). Note that

GFA's printing routines do some rounding themselves.

: Is thare any way to trace a program and to see variables values under
: the Gfa Interpreter editor (Rel. 3.5) more or less like in the PC quick-basic ?

GFA has two commands for tracking certain bits down in a program:

TRACE [ON|OFF] will activate or deactivate tracing; when on, it will display
useful debug information. It's a bit messy, though.

DUMP {varname} lets you dump all (without parameters) or a range (with parameters) of variables and their values. For example DUMP BL will dump all variables that start with BL in them to the screen.

Actually, the 2600 doesn't use flipping. I beleive that the
programmer has to redraw the screen for every frame. Since too many objects
take too long, they have to be drawn alternate screens.

(I may be wrong about this; feel free to jump in and correct me)

How about posting a (small!) piece of relevant code that exhibits the problem.
I've never encountered problems like the one you mention. Just plain fopen()/
fgets()/fclose() sequences work flawlessly.

Hint: try to avoid the use of fscanf. This function is too tricky to be used
safely. Better use fgets() and then (if needed) parse the string you just
read with sscanf().

This should work fine IMO:

```
#include <stdio.h>
#define MAXSIZE 1024
```

```
void do_something_with_buf( char *buf )
{
    fprintf(stderr, "%s", buf);
}

int read_file( char *filename )
{
    FILE *f;
    char buf[MAXSIZE];

    if ((f = fopen(filename, "rb")) == NULL)
        return -1;               /* filename not found or whatever... */

    while (fgets(buf, MAXSIZE, f))
     do_something_with_buf(buf);

    fclose(f);
    return 0;
}

int main( void )
{
    char filename[] = "C:\\TESTFILE.TXT";

    read_file(filename);
    return 0;
}

... untested code ...
```

Though I don't know Pure C's library's, fread() may be what you need...
it depends what you're doing. fread() and fwrite() are for
reading/writing records of some type, like a char[25] or a struct or
whatever.

```
size_t fread (void *buffer, size_t size_of_struct, size_t number, FILE *file);
size_t fwrite (const void *buffer, size_t size, size_t number, FILE *file);
```

buffer - the structure to read/write
size_of_struct - just sizeof(the_buffer) or sizeof(the_struct)
number - how many of these structures to read/write from the buffer
file - a file pointer gotten via fopen()

```
fgets( buffer, max_len, file );
```

will read a line, up to max_len in length from file into buffer. Then
you can parse it yourself. scanf() and fscanf() and sscanf() are pretty
evil, and don't handle bogus data very well.

: Hint: try to avoid the use of fscanf. This function is too tricky to be used
: safely. Better use fgets() and then (if needed) parse the string you just
: read with sscanf().

Remember you can also use fread/fwrite to read or write entire structs:

```
    result=fwrite( &structure,1,sizeof(structure),filehandle);
```

Works great.

Greetings, Michiel

YAC SHAREWARE PROGRAMMING CONTEST

Shareware Programmers: Would $50 help inspire you to finish that program you started over the summer but never finished? What if we could help you distribute your software to local BBS's, the major on-line services, the Internet, and at SAC Expo? We could also help you by writing and printing documentation to go with your program (we can translate from German to English if necessary). We'll even throw in a years membership to our local user-group: with its monthly newsletter mailed directly to you, and the honorary title of YAC Official Programmer for a year...

THE YOLO ATARI CLUB IS HAVING ITS ANNUAL SHAREWARE PROGRAMMING CONTEST.

Entries must be TOS programs new for 1995 and must be received by March 17th, 1995. They will be judged based on originality, compatibility (remember, there are all these new multi-tasking solutions and Falcon resolutions to try and respect), efficiency, and dependability.

Entry is simple, just mail your entry to the Yolo Atari Club at 1129 Fordham Drive / Davis, CA 95616 / USA. Or e-mail us an FTP-able location where your program resides (remember to include your program's name and the full path to it), although give us an extra week if you plan to do this so we can be sure to have time to download it. We can be reached at elhays@ucdavis.edu. Remember to give us a way to contact you. The winner will be notified by the end of March and then announced on-line and at the Sacramento Atari Computer Exposition, April 22nd, 1995.

Entry is free (or the cost of a single letter), and could earn you $50, fame, and glory. So why not give it a try?

>gEts().

gets() should work okay, but scanf("%s",string) treats the space character
as a separator. Try scanf("%[^\n]",string) (i.e. assign everything up to
(but not including) the end of the line to "string").

>Also how do you assign a valuE to an ElEmEnt of a structurE I havE triEd
>customEr[n].c_namE=namE;
>But Each timE I compilE it I gEt an Error saying I nEEd to usE an LvaluE.

On the assumption that namE is a string, you can't assign a string in this
manner. Try using strcpy(customEr[n].c_namE,namE); instead.

Stephen

Devpac 3.10 should satisfy your needs. As I recall it comes with a book
covering the Falcon OS, I've never read it though. Otherwise a really good
book is "The Atari Compendium" by Scott Sanders (S.SANDERS2@genie.geis.com).

When it comes to C compilers I would choose Lattice C, while others might
think that GNU C++ is a better choice. I've never been able to get GNU C to
work, so I don't know...

As to where you can get this software I don't know, because I don't live in
the USA, but you can FTP GNU C++ from atari.archive.umich.edu.

Rod McCall was heard to say:

> I URGENTLY need help with Pure C. I simply cannot get it to read files!!
> I have tried fgets and fscanf. Niether of these seem to work.

You did open the file first right? Try this:

```
#include <stdio.h>   /* Stdio your code!  By LoReal */

void main() {
   FILE *fp;           /* How we hang on to files */
   char line_o_text[81];

   if( (fp=fopen("readthis.dmt","r")) == NULL ) {
      printf( "Hey, I couldn't even open this sucker!\n" );
      exit(1)
   }
   /* fp now controls read access to the file readthis.dmt */
   while( !feof(fp) ) {
      fgets( line_o_text, 80, fp );
      printf( "%s\n", line_o_text );
   }
   fclose( fp );
}
```

If this doesn't work, there is something wrong with the universe (or just me -- it's not like I've tried to compile this or anything).

K

Only if you're sure the original data was written an the same kind of
machine...
The only portable way to read/write structs is the field-by-field way, since
different machines may use different padding schemes, etc, etc.

>In other words, is Heat n' serve linked expressly with Sozobon?

Heat 'n' Serve is version 1.33 of Sozobon with several bug fixes and other
enhancements. It was written (or altered from Sozobon) by Ian Lepore, so
it never had the support of the Sozobon folks, and now that Ian is out of
the Atari scene, it doesn't have any support. The main advantage to Heat
'n' Serve C is the ease of installation; it does all the work by itself.
With other public domain C compilers (such as GNU), you have to do all the
work yourself, including setting environment variables. For GNU it's not
too hard, though. The documentation describes how to set it up, with
specific examples for running it from within the public domain Gulam
unix-like shell. Also, Warwik Alison did an article in one of the Atari
Explorer Online Programmer's Journals (AEOPJ) - number two, I think - which
tells all the files you need to get GNU C or GNU C++ (difference is only a
few libraries) up and running.

The one real disadvantage of H&S C is that it is an unsupported K&R-style C compiler. This means that a lot of the excellent GEM libraries that have come out recently (like EGEM) are not compatible with it. Being unsupported, it won't ever be upgraded to ANSI C to be compatible with modern code and libraries. I suppose I should add "to my knowledge," as it's always possible someone has found a way around this.

And of course, you're not going to be doing any C++ programming in H&S C. It's a nice way to get started, but in my opinion you'd be better off learning ANSI C from the start. There aren't too many differences, but at least you'd be able to program on all modern compilers and you'd be one step closer to C++, which is becomming very wide-spread.

Regards,
Tom

Hi,
has anyone out there managed to compile _any_ of the Gnu binutils-2.5.2 package - I can't compile any of it because the configure script gets very unhappy and comes up with ': command not found' several times before exiting without setting
anything up.

The reason that I need to compile the binutils is that I _need_ an 80x86 disassembler that will run on my TT.

I hope someone can help,
Cheers,
Joe.

P.S. I am using a TT030, 2Mb STRAM,8Mb TTRAM, gcc2.5.8, Mint 1.12 , bash , make 3.63
....

Hey, a new newsgroup! How long has this been around? (I just noticed it this afternoon).

> Any ST programmers out there handled the joystick?
> I looked at the joystick and mouse library routines that return packets
> of info, and balked (not having any real explanation of how to use them)
> and did a memory scan and just found where the old 8-bit style info was
> coming through in memory, and just read those locations (they're in
> different places on my ST vs. my STe, though...).
> I'd be curious to see what others have done.
> BTW, I use the Laser C compiler & assembler, and like them a lot.

PLEASE, don't just use a memory address! If it is not documented, this is almost certain to be different for all the ST/STE/Falcon systems and may not even be the same for various TOS versions. It's a pain, but you really should use the packet system.

I don't have any code here that does this, but as far as I remember you just alter the mousevec and joyvec pointers returned by Kbdvbase() to point to functions of your own, which will be called whenever the mouse

or joystick change state. They will be passed a pointer to an array of three bytes which contain the data, but I can't remember how it is coded. Also I think you have to use Ikbdws() to put the keyboard handler into joystick mode: does anyone know how this works?

If you want I will try to dig out my old routine: also I seem to remember seeing a game library by Warwick Allison (called ams?) that contained some joystick code.

Could anyone give me a few pointer on adding music to a game I am writing? I am particularly interested in using sampled sounds, something like playing a .mod file in the background, but I don't have any experience with using samples on the Atari. Is an interrupt driven mod player a good approach to use? How much cpu time would this take up? (I am using an STE, and am not worried about my code running on old ST's). I have some docs on the .mod file format, but I would really like some examples of code that uses the STE's DMA system, so I could get an idea how this is done.

Hi,

I am trying to write various programs using Prospero C, which I got off the ST
Review
coverdisk. As this came from a coverdisk, I have no manual.

How can I include a piece of machine code (assembled in Devpac 2) to be run as a
procedure
in Prospero.

Thanks

Anthony

Does anyone out there know how to display 512 colours (on a ST - 4096 STe) on the screen at once? I would like to be able to use such a thing as a background, possibly using a spectrum picture....
I know the theory behind it all (i.e. Palette switching in the horizontal blank) but I would love to know exactly *how* to do it! If anyone has an appropriate bit of sorce code or could explain how to display a spectrum picture file then could they please post / e-mail me with a reply.

Thanks,
George

Get the sources from your nearest GNU archive (as superopt-2.3.tar.gz)
which includes the docs and complain loudly where you got the binary
from.

You need to create a link file. If you want me to send you a sample
of one that I use, email me. Or, if enough people want, I can post it.

Mike
whitema@cig.mot.com

P.S. And yes, I voted no on this group also.

In your program, the variable TRACE$ contains the current line being
executed (in the interpreter only).

TRACE ON/OFF enables you to see what lines are being executed. Or if you
use 'TRACE procedure', you can write your own procedure to display
whatever variables you want. This procedure will be called after every
line when TRACE ON.

Hi Peter.

Well I found this code sitting on a disk and thought it seemed like exactly what you are after. (I hope!)

I'm posting a copy of this to the .programmer group also.

Have fun,
Richard =8-]

From: koreth@ssyx.ucsc.edu (Steven Grimm)
Newsgroups: comp.sources.atari.st
Subject: v01i003: Joystick-reading routines
Keywords: Laser
Approved: koreth@ssyx.ucsc.edu
Submitted-by: sirkm@ucscb.ucsc.edu (Greg Anderson)
Posting-number: Volume 1, Issue
Archive-name: joyread

[Lots of STers seem to have trouble reading the joystick ports, which is much
 more painful on the ST than on the 8-bit. These routines should help make
 it easier. Note that these are just some routines, and not a complete
 program. -sg]

```
/*-----------------------------------------------------------------------
| Stick.c:  Joystick interupt service routine
|
| Placed in the public domain March 1988 by Greg Anderson.
|
|      The joystick demo by Steve Jankowski was instrumental to
|                  the creation of these routines.
|
|   Many thanks to Steven Grimm for providing essential information
|               and the aforementioned joystick demo.
|
|#######################################################################
| THESE ROUTINES ONLY WORK UNDER LASER C!  THEY MUST BE MODIFIED FOR
| OTHER C COMPILERS, _INCLUDING_ MEGAMAX C VERSION 1.xx!
|
| MegaMax instructions:  A4 must be saved somewhere so that it is
|     available durring the isr.  Then, the isr can access joyinf
|     with "lea joyinf(A4),A1" instead of "lea joyinf,A1".
|#######################################################################
|
|     This package sets up an interupt to read the joystick on the
| ST.  The joystick is read via the ikbd--the intelligent keyboard
| interface chip.  The ikbd can be placed into "joystick-reading
| mode" by sending an appropriate command with Ikbdws().  This has
| two effects:  first, the mouse is disabled.  Second, the ikbd will
| be prompted to send a three-byte packet every time one of the
| joysticks changes states.  The packet is as follows:
|
|     [Stick #]  [State of Stick 0]  [State of Stick 1]
|
|     The first byte is $FE if stick 0 changed, or $FF if stick 1
| changed.  These routines ignore the first byte.
|     The next two bytes contain the states of sticks 0 and 1.
```

```
| There values will be the sum of:
|
|                  +1    (+128)
|                   |
|            +4 ---< >--- +8
|                   |
|                  +2
|
|     Add the apropriate value if the contact is down.  For example,
| if stick 0 is NW and the trigger has not been pressed, its
| current state will be 1 + 4 = 5.
|
|     These packets are sent to a routine pointed to by "joyvec".
| Joyvec is part of the structure returned by Kbdvbase().  Joyvec
| can be changed to point to an interupt service routine (isr) of
| our devising.  If this is done, the isr will find that A0 points
| to the first byte of the the packet sent by the ikbd.  The isr
| must be very short (less than 1ms exicution time).  Atari's docs
| of Kbdvbase indicate that a copy of the pointer to the packet is
| also deposited on the stack; however, this does not appear to be
| the case.
|
| Using these routines:
|
| Call stick_init() to set up the joystick isr and place the ikbd
|    into joystick send mode.  This will also disable the mouse.
|
| stick_exit() will return the ikbd to mouse send mode.  Your
|    program should do this before exiting.
|
|    Once the initialize routine has been called, the following
| commands are available:
|
| _stick(n):  Return the state of stick N.  (See above chart)
| stick(n) :  Return the direction of stick N.  (Minus the trigger)
| trig(n)  :  Return the state of the trigger on stick N.
| hstick(n):  Return the horizontal position of stick N.  (-1 to +1)
| vstick(n):  Return the vertical position of stick N.

Might I suggest we drop this? The group was voted on by people in a
variety of 'net places and it exists; some people like it and others don't.
Let's all just leave it at that, and get on with what this group was
created for: discussing programming on Atari computers and consoles.

I for one don't want to read a lot flames and complaints, even if I did
make the mistake of responding to one of them.

Tom

I agree, what is the problem anyway?

I am interested in updating objects in a window which may be partially concealled by other windows. Initially, these objects will take the form of an in-window menu, but later it will probably also include buttons and status bars. My question is how can I find the coordinates necessary to set VDI clipping rectangles so that I only draw in the visible parts of my window?

I would very much appreciate it if someone could tell me where I can find source code to demonstrate this.

Thanks,

Tom Hopper

> two, too.

Correct. I draw my sprites in NeoChrome and then import them into the
sprite editor where I can make final adjustments such as "hotspots" and

block orientation. Try that previous example and see if it works. The one that looks like this:

```
10 p=hunt$("PALT",start(1) to start(1)+256)
20 p=p+4
30 for l=0 to 15
40 colour(l)=deek(p)
50 p=p+2
60 next l
```

This should search for the string "PALT" in bank #1 (sprite bank) and then change the colors to their saved values. I was not aware that the palette data was stored in the sprite bank. I'll check this out tonight.

With the TRON command enabled you will see the program lines flow veeery
quickly and you can't see variables values, what will be great is a TRON/STEP
debug mode, where you could run your program step by step.

Which are the methods used by you GFA Programmers ?

Your display problem isn't really your fault. It's a problem with Antic.
Antic doesn't like it when a display list crosses a 4k boundary. When a d/l
does, you get the garbage you described. It's best to start the display on
an even boundary. If you're using a string, locating it properly is a bit
of a black art. I've seen programs which DIM a string of a single
character, find its address, then DIM a "waste" string to occupy memory up
to the next boundary.

How to work around it? For graphics modes 8,9,10,11 and 15, which occupy
just under 8k, the system d/l has two LMS (load memory scan) instructions.
For a BASIC program, though, updating two or more locations would result in
very choppy movement.

You could limit your scrolling display to 4k, or duplicate the necessary
portions between two 4k blocks.

You have to "walk the rectangle list" for each window you are
redrawing. This is a standard (and compulsory) technique, you can find
some helpful code in Tim Oren's ProGEM series at all good ftp sites
(eg a.a).

Briefly, given the window handle you want to redraw, say 'win',

```
     wind_get(win, WF_FIRSTXYWH, &x, &y, &w, &h);
```

Returns the first visible rectangle of the window in x/y/w/h.

To get subsequent rectangles keep calling:

```
     wind_get(win, WF_NEXTXYWH, &x, &y, &w, &h);
```

The last rectangle in the list will have w == 0 && h == 0.

I think that the manual shows a good example of using TRACE which allows
the program to run (under the interpreter) with the current lines being
shown at the bottom of the screen - scroll in it's own virtual screen.

Hi,

I need a techical description of the Atari Portfolio extension bus, because
I am going to use it for control tasks. Does anyone have an idea where I
could obtain such information?

Please answer per email to dimiter@cs.tu-berlin.de

Thank you in advance, it would be e great help for me if someone answered.

With best regards,
Dimiter

From what I read here earlier, there was no discussion in the non-ST
atari groups, yet now we have atari.programmer, not atari.st.programmer.

PS I do not intend to unsubscribe to a group just because I thought that
   its creation was badly mishandled, or because I voted against it.
   There's always the possibility that I was wrong about the excessive
   crossposting etc, time will tell.

> from the menu?

It does indeed, although it may produce cleaner code if you just send
yoursef a redraw message whenever an update is needed rather than calling
the display code directly.

Walking the rectangle list might well produce several rectangles, and a
typical redraw routine will be run once for each of these with the VDI
clip set to the appropriate area of the screen. You can do this whenever
you like, but if you have recieved a WM_REDRAW message you can optimise
the redraw by ignoring any rectangles in the list which don't intersect

the area that the message specified as 'dirty'.

Also don't forget to call wind_update(BEG_UPDATE) before you start the redraw and wind_update(END_UPDATE) when you are finished, to prevent any menus dropping down or windows being moved over the area while you are drawing onto it.

Does anyone know how to recognize when a program is being run as an accessory with GNU C? I know that d0 contains values which will tell me this when the program starts, but since I don't know any assembly, I would rather find some easier way of doing it.

If anyone knows where I can find documentation that would explain this, I would very much appreciate it if you'd tell me.

If possible, please respond to the following email address (not the one I'm sending from):
t.hopper@genie.geis.com

Email to the current address will very likely bounce, as I'm closing this account.

Thanks,

Tom Hopper

Here's an example link file that works. Note that you have to keep the total path name a little on the short side, or else you can't open the file with the editor.

D:\SRC\UNO\UNO\UNO.PRG
N

```
Y
Y
Y
N
D:\APPS\C\CFIRST
D:\SRC\UNO\UNO\UNO
D:\SRC\UNO\BLD_DECK\BLD_DECK
D:\SRC\UNO\CHOSE1ST\CHOSE1ST
D:\SRC\UNO\SETCOLOR\SETCOLOR
D:\SRC\UNO\SHUFFLE\SHUFFLE
D:\SRC\UNO\UPDATE_P\UPDATE_P
D:\APPS\C\CGEM/S
D:\APPS\C\CLIB/S
D:\APPS\C\LAST

The first line is the executable to be produced.
The 2nd line (N above) is to wheter alter the default stack size (of 4k).  If
    you want a different stack size, use the following:
        Y
        <stack size in bytes>
The third line is Y if you want a module map, N otherwise.
The fourth line is Y is you want a symbol map, N otherwise.
The fifth line is Y if you want a section map, N otherwise.
The sixth line is only present if a Y is present in the thrd, fourth, or
    fifth lines.  It is Y if you watn to include names starting with a
    period ("."), N otherwise.
The rest are the modules to link.  CFIRST must always be first, LAST must
    always be last.  If a file or library is followed by a "/S", it is
    scanned selectively.

Hope this helps!

Mike

If you request to format with more than 15 sectors per track flopfmt()
will switch to HD format.
